

## **KDT900 – Importing Registry Keys**

### **Introduction**

The KDT900 can automatically import Windows Embedded CE Registry Keys into the operating system's registry on boot.

### **.reg Files**

During a cold boot sequence, the KDT900 will search the "Startup" subdirectory of the internal SD card (mounted as "Storage Card") for all files that end with a ".reg" file extension. ".reg" files should be ANSI encoded text files. The KDT900 will load all ".reg" files located in the "Startup" directory, but no order of import can be guaranteed.

### **.reg File Format**

The KDT900 uses the standard Microsoft format for registry entry files, however the import will only handle DWORD and string values. For more information on the file format, visit: <http://support.microsoft.com/kb/310516>

### **Example Registry Entries**

```
[HKEY_LOCAL_MACHINE\Drivers\AML\Magstripe]
    "Enable"=dword:1
```

```
[HKEY_LOCAL_MACHINE\Init]
    "Launch99"="PlatformStartup.exe"
```

There is no way to delete previously imported keys.
