1 Getting Started

Figure 1: GLK240128-25-WB

The GLK240128-25 is an intelligent graphic LCD display designed to decrease development time by providing an instant solution to any project. With the ability to communicate via serial RS-232/TTL and I²C protocols, the versatile GLK240128-25 can be used with virtually any controller. The ease of use is further enhanced by an intuitive command structure to allow display settings such as backlight brightness, contrast and baud rate to be software controlled. Additionally, text and fonts may be uploaded to the display and stored in the on board memory.

1.1 Display Options Available

The GLK240128-25 comes in a variety of colors including the standard yellow/green, the popular blue/white and the crisp white/grey. Extended voltage, and temperature options are also available, to allow you to select the display which will best fit your project needs.

Figure 2: GLK240128-25 Options

1.2 Accessories

NOTE Matrix Orbital provides all the interface accessories needed to get your display up and running. You will find these accessories and others on our e-commerce website at http://www.matrixorbital.com. To contact a sales associate see Section 15.3 on page 62 for contact information.

Figure 3: 5V Power Cable Adapter

Figure 4: 12V Power Cable Adapter (V/VPT Models)

Figure 5: Breadboard Cable

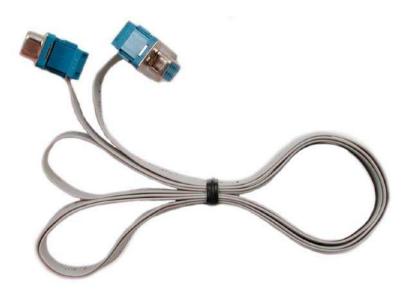

Figure 6: Serial Cable 4FT

Figure 7: Communication and 5V Power Cable

Figure 8: 4X4 Keypad

1.3 Features

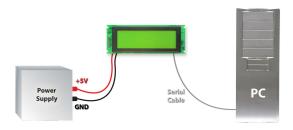

- 240 x 128 pixel graphics display
- Selectable communication protocol, RS-232 or I²C
- 128 byte buffered communication
- 16 KB flash memory for fonts and bitmaps
- Lightning fast communication speeds, up to 115 kbps for RS-232 and 400 kbps for I²C
- Display text using built in or user supplied fonts
- Adjustable contrast
- Adjustable backlight brightness
- Default 19.2 kbps serial communication speed
- Extended temperature available for extreme environments of -20C to 70C
- Extended voltage and efficient power supply available
- Support for up to a twenty-five key matrix style keypad

1.4 Connecting to a PC

The GLK240128-25 connects seamlessly to a PC and it is an excellent means of testing the functionality and uploading new fonts and bitmaps. You will require a standard RS-232 9-pin serial cable such as the one pictured in *figure 6 on page 3*, as well as a modified 5V power adapter such as the one pictured in *figure 3 on page 2*.

In order to connect your display to a personal computer follow these easy instructions:

- 1. Plug the serial cable into the com port you wish to use.
- 2. Connect the modified 5V power adapter to a power lead from your PC power supply (you will have to open your computer case).
- 3. Connect the serial cable to the DB-9 connector on the back of the display.
- 4. Connect the 5V power adapter to the 4-pin connector on the back of the display.

WARNING DO NOT use the standard floppy drive power connector, as this will not provide you with the correct voltage and will damage the display module.

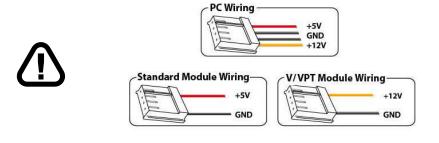

Figure 9: PC vs Matrix Orbital Display Module Wiring

1.5 Installing the Software

1.5.1 MOGD#

MOGD# is the latest updated version of MOGD and can be used to manage font and graphics downloads as well as exercise all of the features of our graphical displays. MOGD# provides a new user friendly interface as well as many feature enhancements.

To install MOGD# from the Matrix Orbital CD, follow the following steps:

- 1. Insert the Matrix Orbital Cd-ROM into the CD drive
- 2. Locate the file *MogdSharp.zip*, which should be in the "CD-drive:\Download" directory
- 3. Unzip MogdSharp.zip to a temporary directory using a program such as Winzip, Pkzip, etc.
- 4. Double click on "setup.exe"
- 5. Follow the instructions on the screen to complete the installation
- 6. MOGD# requires the .NET framework 2.0 and will download and install it automatically

After the installation is complete there will be a Matrix Orbital entry under "Start->Programs->Matrix Orbital" in the start menu. Click on the 'Mogd Sharp' entry to run the program.

Be sure to check the information selected in the configuration panel the first time MOGD# is run. Once this information is entered correctly the program can be used to control all functions of the graphic display.

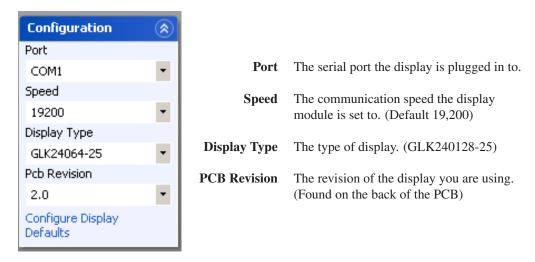

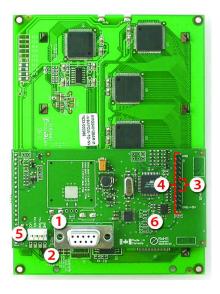

Figure 10: Mogd Sharp Settings

NOTES

- MOGD# may also be downloaded from Matrix Orbital's support site at http://www.matrixorbital.ca/software/software_graphic/MogdSharp
- Winzip is available as a free download from http://www.winzip.com

2 Hardware Information

Refer to the following diagram for this chapter:

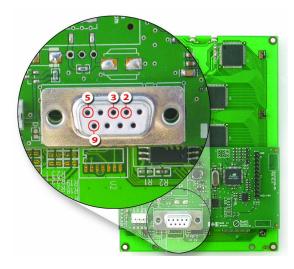

- 1 DB-9 Connector
- **4** Keypad Interface Connector
- 2 Power Through DB9 Jumper
- 5 Power / Data Connector
- 3 Manual Override
- **6** Legacy Connector Jumper

Figure 11: GLK240128-25

2.1 DB-9 Connector

The GLK240128-25 provides a DB-9 Connector to readily interface with serial devices which use the EIA232 standard signal levels of ± 12 V to ± 12 V. It is also possible to communicate at TTL levels of 0 to ± 12 V by setting the *Protocol Select Jumpers* to TTL. As an added feature it is also possible to apply power through pin 9 of the DB-9 Connector in order to reduce cable clutter. However, in order to accomplish this you must set the *Power Through DB-9 Jumper*.

Pin 2 Rx \ SCL (I^2 C clock) Pin 3 Tx \ SDA (I^2 C data)

Pin 5 GND

Pin 9 PWR (Must solder Power Through DB-9 Jumper. See table 1 on the next page for power requirements.)

Figure 12: RS-232 Pin-out

2.1.1 Power Through DB-9 Jumper

In order to provide power through pin 9 of the *DB-9 Connector* you must place a solder jumper on the *Power through DB-9 Jumper* pictured in *figure 13* below. The GLK240128-25 allows all voltage models to use the power through DB-9 option, see table 1 on the following page for display module voltage requirements.

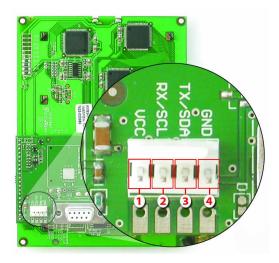

Figure 13: Power Through DB-9 Jumper

WARNING Do not apply voltage through pin 9 of the DB-9 connector AND through the Power/Data Connector at the same time.

2.2 Power/Data Connector

The *Power/Data Connector* provides a standard connector for powering the display module. The GLK240128-25 requires five volts for the standard display module, between nine to fifteen for the wide voltage (V) and between nine to thirty-five volts for the wide voltage with efficient power supply module (VPT). The voltage is applied through pins one and four of the four pin *Power/Data connector*. Pins two and three are reserved for serial transmission, using either the RS-232/TTL or the I²C protocol, depending on what has been selected by the *Protocol Select Jumpers*. Pins two and three may be reversed by changing the *Legacy Connector Jumpers* in order to be compatible with previous PCB revisions.

Pin 1 PWR (See table 1)

Pin 2 Rx \ SCL (I^2 C clock)

Pin 3 Tx \ SDA (I^2 C data)

Pin 4 GND

Figure 14: Power Connector and Pin-out

Table 1: Power Requirements

	Standard	-V	-VPT		
Supply Voltage	+5Vdc ±0.25V	+9V to +15V	+9V to +35V		
Supply Current	31 mA typical				
Supply Backlight Current	-				

WARNINGS

- Do not apply any power with reversed polarization.
- Do not apply any voltage other than the specified voltage.

2.3 Protocol Select Jumpers

The *Protocol Select Jumpers*, pictured below in *figure 15*, provide the means necessary to toggle the display module between RS-232, TTL and I^2C protocols. As a default, the jumpers are set to RS-232 mode with zero ohm resistors on the 232 jumpers. In order to place the display module in I^2C mode you must first remove the zero ohm resistors from the 232 jumpers and then solder the resistors on to the I2C jumpers. The display will now be in I^2C mode and have a default slave address of 0x50 unless it has been changed. Similarly, in order to change the display to TTL mode, simply remove the zero ohm resistors from the 232 or I^2C jumpers and solder them to the TTL jumpers.

Figure 15: Protocol Select Jumpers

2.4 Keypad Interface Connector

The GLK240128-25 provides a *Keypad Interface Connector* which allows for up to a five by five matrix style keypad to be directly connected to the display module. Key presses are generated when a short is detected between a row and a column. When a key press is generated a character, which is associated with the particular key press, is automatically sent on the Tx communication line. If the display module is running in I²C mode, the "Auto Transmit Keypress" function may be turned off, to allow the key presses to remain in the buffer so that they may be polled. The character that is associated with each key press may also be altered using the "Assign Key Codes" command, for more detailed information see the *Keypad Section*, *on page 36*.

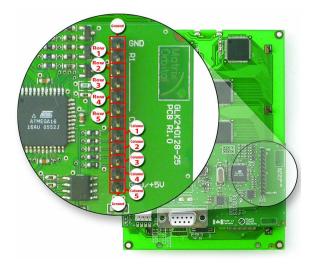

Figure 16: Keypad Interface Connector

2.5 Manual Override

Manual Override is provided to allow the GLK240128-25 to be reset to factory defaults. This can be particularly helpful if the display module has been set to an unknown baud rate or I²C Slave Address and you are no longer able to communicate with it. If you wish to return the module to its default settings you must:

- 1. Power off the display module.
- 2. Place a jump between Row 5 and Column 1.
- 3. Power up the display module.
- 4. The display module is now set to its default values listed below in table 2.
- 5. Edit and save settings.

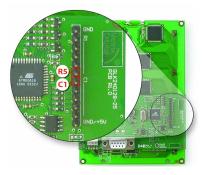

Figure 17: Manual Override Jumper

Table 2: Default Values

Contrast	128
Backlight	255
Baud Rate	19.2 kbps
I ² C Slave Address	0x50
Data Lock	False
RS232AutoTransmitData	True

NOTE The display module will revert back to the old settings once turned off, unless the settings are saved.

2.6 Filesystem Lock Jumper

The *Filesystem Lock Jumper* allows you to lock the filesystem on the GLK240128-25 so that no fonts or bitmaps can be either written or deleted from the on board memory. This feature is useful in order to protect data integrity of production units, if protection of other settings is required see *Section 12.1*.

To lock the filesystem, solder a zero ohm resistor or use a solder jumper on the *Filesystem Lock Jumper* pictured in *figure 18* below, with a lock symbol becide it.

Figure 18: Filesystem Lock Jumper

3 Troubleshooting

3.1 The display does not turn on when power is applied.

• First, you will want to make sure that you are using the correct power connector. Standard floppy drive power cables from your PC power supply may fit on the Power/Data Connector however they do not have the correct pin-out as can be seen in *figure 9 on page 6*. Matrix Orbital supplies power cable adapters for connecting to a PC, which can be found in the *Accessories Section on page 2*.

- The next step is to check the power cable which you are using for continuity. If you don't have an ohm meter, try using a different power cable, if this does not help try using a different power supply.
- The last step will be to check the *Power/Data Connector* on the GLK240128-25. If the *Power/Data Connector* has become loose, or you are unable to resolve the issue, please contact Matrix Orbital see 15.3 on page 62 for contact information.

3.2 The display module is not communicating.

- First, check the communication cable for continuity. If you don't have an ohm meter, try using a different communication cable. If you are using a PC try using a different Com port.
- Second, please ensure that the display module is set to communicate on the protocol that you are using, by checking the *Protocol Select Jumpers*. To change the protocol used by the display module see *Section 2.3 on page 11*.
- Third, ensure that the host system and display module are both communicating on the same baud rate. The default baud rate for the display module is 19200 bps.
- If you are communicating to the display via I²C please ensure that the data is being sent to the correct address. The default slave address for the display module is 0x50.

NOTE I²C communication will always require pull up resistors.

• Finally, you may reset the display to it's default settings using the *Manual Override Jumper*, see *Section 2.5 on page 12*.

3.3 The display module is communicating, however text cannot be displayed.

- The cause of this is often that no font has been loaded onto the display. To load a font onto the display see *Section 4.2.1 on page 16*.
- Another common cause may be that the contrast settings have been set to low. The solution to this problem is to adjust the contrast settings, the default setting that will work in most environments is 128.

NOTE Optimal contrast settings may vary according to factors such as temperature, viewing angle and lighting conditions.

3.4 There is a problem uploading fonts or bitmaps.

- First, ensure that you can communicate to the display. A good test is to use a PC, with MOGD# installed, to connect to the display. See *Section 1.4 on page 6* for setting up a PC to test the GLK240128-25.
- Second, unsure that the *Filesystem Lock Jumper* has not been set. See *Section 2.6 on the previous page*.

 Third, please ensure that the display module's memory is not full. The GLK240128-25 has 16 Kb of memory for fonts and bitmaps.

NOTE If you are unable to resolve any issue please contact Matrix Orbital. See 15.3 on page 62 for contact information.

4 Communications

4.1 Introduction

The commands listed in this chapter describe how to configure data flow on the RS232/TTL and I²C port. The display has built in flow control which may be useful when long strings of text are downloaded to the display. Flow control is enabled or disabled by two commands. If flow control is enabled, the display will return an "almost full" message (0xFE) to the controller when its internal buffer fills to a defined level, and an "almost empty" message (0xFF) when the buffer contents drop to a defined level.

4.1.1 I²C Communication

The GLK240128-25 is capable of communicating at 400 Kbps in I^2C mode, with 127 units addressable on a single I^2C communication line. However, in order to communicate via I^2C you must first set the Protocol Select Jumpers as can be seen in *Section 2.3* and ensure that pull up resistors, with a nominal value of 1K to 10K, are placed on the SCL SDA communication lines coming from pins two and three of the Data / Power Connector respectively. The GLC24064 uses 8-bit addressing, with the 8th bit designated as the read write bit, a 0 designates a write address and a 1 designates a read address. The default read address of the display module will be 0x51, whereas the write address is 0x50 by default, to change the I^2C address see section 8.2.1.

When communicating in I²C the GLC24064 will send an ACK on the 9th clock cycle when addressed. When writing to the display module, the display will respond with a ACK when the write has successfully been completed. However if the buffer has been filled, or the module is too busy processing data it will respond with a NAK. When performing a multiple byte read within one I²C transaction, each byte read from the slave should be followed by an ACK to indicate that the master still needs data, and a NAK to indicate that the transmission is over.

4.1.2 Serial Communication

In addition to being able to communicate via I^2C the GLC24064 communicates natively through the RS-232 protocol at a default baud rate of 19,200 bps and is capable of standard baud rates from 9600 to 115200 bps. Furthmore the GLC24064 is also capable of reproducing any non-standard baud rate in between using values entered into our baud rate generation algorithm and set through command 164 (0xA4). The display module communicates at standard voltage levals of . at $\pm 12V$ to $\pm 12V$ or at TTL levels of 0 to +5V by setting the *Protocol Select Jumpers* to TTL.

4.2 Turn Flow Control On

Syntax Hexadecimal 0xFE 0x3A [full] [empty]

Decimal 254 58 [full] [empty] ASCII 254 ":" [full] [empty]

Parameters

Parameter	Length	Description
full	1	Bytes remaining before issuing a
		almost full message.
empty	1	Bytes available before issuing a
		almost empty message.

Description

This command enables flow control. When the buffer fills so that only [full] bytes are available, the display will return an "almost full" message (0xFE) to the host controller. When the buffer empties so that only [empty] bytes remain, the display will return an "almost empty" message (0xFF) to the host controller.

The display will return the "almost full" message for every byte sent to the display until the used buffer space once more drops below the [full] level. Whether the user is in 'flow control mode' or not, the module will ignore display or command bytes which would overrun the buffer. While in 'flow control mode' the unit will return 0xFE when buffer is almost full even though it may have already thrown rejected data away. The buffer size for the display is 80 bytes.

When using this command in an application, selection of the value for the buffer [full] should be considered very carefully. This is a critical aspect to be able to use this feature to it's full potential. When using a host system or PC which contains a FIFO, the user should set the value of [full] equal to or greater than the size of the FIFO. The reason for this is that the FIFO may be full when the host system receives 0xFE. In the case of 16550 UART the size at its maximum is 16, therefore the value of [full] should be set to 16 or greater.

Remembered Yes

4.3 Turn Flow Control Off

Syntax Hexadecimal 0xFE 0x3B

Decimal 254 59 ASCII 254 ";"

Description This command turns off flow control. Bytes may overflow the buffer

without warning.

Remembered Yes

4.4 Changing the I²C Slave Address

Syntax Hexadecimal 0xFE 0x33 [adr]

Decimal 254 51 [adr] ASCII 254 "3" [adr]

Parameters Parameter Length Description

Parameter Length Description
adr 1 The new I²C write address (0x00 - 0xFF).

Description This command sets the I²C write address of the module between 0x00

and 0xFF. The I^2C write address must be an even number and the read address is automatically set to one higher. For example if the I^2C write

address is set to 0x50, then the read address is 0x51.

NOTE The change in address is immediate.

Remembered Always

4.5 Changing the Baud Rate

Syntax Hexadecimal 0xFE 0x39 [speed]

Decimal 254 57 [speed] ASCII 254 "9" [speed]

Parameters Parameter Length Description
speed 1 Hex value corrisponding to a baud

rate.

Description This command sets the GLC's RS-232 port to the specified [speed]. The

change takes place immediately. [speed] is a single byte specifying the desired port speed. Valid speeds are shown in the table below. The GLC can be manually reset to 19,200 baud in the event of an error during transmission, including transmitting a value not listed below, by setting themanual override jumper on the GLC controller board during power

up. This command is ignored until this jumper is removed again.

Hex Value	Baud Rate
0xCF	9600
0x8A	14400
0x67	19200
0x44	28800
0x33	38400
0x22	57600
0x19	76800
0x10	115200

Remembered Always

4.6 Setting a Non-Standard Baud Rate

Syntax	Hexadecimal	0xFE 0xA4 [speed]
	Decimal	254 164 [speed]

Parameters	Parameter	Length	Description
	speed	2	Inputed LSB MSB from baud rate
			formula (12-2047).

Description This command sets the RS-232 port to a non-standard baud rate. The

command accepts a two byte parameter that goes directly into the modules baud generator. Use the formula, $speed = \frac{16,000,000}{8 \times DesiredBaud} - 1$ to calculate the [speed] for any baud rate setting. The speed can be anywhere from 12 to 2047 which corresponds to a baud range of 977 to 153,800 baud. Setting the baud rate out of this range could cause the display to stop working properly and require the Manual Override jumper to be set.

Remembered Always

Examples

$$speed = \frac{16,000,000}{8 \times DesiredBaud} - 1$$
 $speed = \frac{16,000,000}{8 \times 115,000} - 1$

$$speed = 17.391 - 1$$

$$speed = 16.391$$

- **LSB** = 0x16
- MSB = 0x00

NOTE Results from the formula are rounded down to the nearest whole number (12.9 =12).

Fonts 5

Introduction 5.1

The GLC24064 comes loaded with the 'Small Filled' and 'Futura Bk BT 16' fonts by default however, it is capable of displaying any font that is uploaded to it in the correct format. MOGD# provides a simple method of generating font files from your installed fonts. For instructions on how to install MOGD# see Section 1.5.1 on page 7.

5.1.1 **Font File Format**

A font file consists of three parts, a header, a character table and bitmap data.

- 1. Header (4 bytes)
 - (a) Nominal Width (1 byte)

 - (b) Height (1 byte)(c) ASCII Start Value (1 byte)
 - (d) ASCII End Value (1 byte)
- 2. Character Table (3 bytes for every character between the ASCII Start and End values inclusive)
 - (a) High Offset MSB (1 byte)
 - (b) Low Offset LSB(1 byte)
 - (c) Character Width (1 byte)
- 3. Bitmap Data

5.1.2 Creating a Font

The following is an example of how to create a font file for the letters h, i and j.

First you must create the bitmaps containing the character data in bitmap form. *Figure 19* below illustrates the bit pattern for the h, i and j bitmap data.

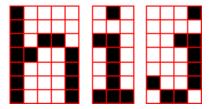

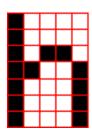

Figure 19: Bitmaps for h, i, and j

Second you may begin to create the font file starting with the header. The header will contain the nominal width, the height and the ASCII start and end values inclusive that you wish to create characters for.

Table 8: Font File Header

Nominal Width Height		ASCII Start Val	ASCII End Val	
0x05	0x07	0x49	0x4B	

Next we will have to find out how many bytes each character will use up, in order to create the character table. The bitmaps are encoded horizontally and may have variable widths, h has a width of five, i a width of three and j a width of four, see the figure below for an example of encoding the first letter h:

	Bitn	nap l	Data		Byte	Hex Value
1	0	0	0	0		
1	0	0	0	0	10000100	0x84
1	0	1	1	0	00101101	0x2D
1	1	0	0	1	10011000	0x98
1	0	0	0	1	11000110	0xC6
1	0	0	0	1	00100000	0x20
1	0	0	0	1		

Figure 20: Bitmap Encoding

As you can see the letter h will take up five bytes with the last five bits being zero padded to form a full byte. So if you continue the process you will get the character data as seen in *table 5.1.2*.

Character Data

		Cha	racter I	Byte Size (For Reference)		
h	0x84	0x2D	0x98	0xC6	0x20	0x05
i	0x43	0x24	0x84			0x03
j	0x2D	0x98	0x19	0x60		0x04

The second part of the font file is the character table. The character table is comprised of three bytes for every glyph in the font file.

The first two bytes represents the position, in bytes, of the glyph stored MSB LSB referenced from the beginning of the file (including the header. The third byte is the width of the glyph in pixels. So because there will be 0x09 bytes in the character table (three bytes for each glyph) and four bytes in the header section, the first entry in the table will be 13, or 0x00 0x0D in hexadecimal, and 0x05 for the width.

To calculate the second entry in the character table, representing the position and width of the second glyph, take the offset of the first entry and add the size of the first bitmap in bytes. Since the first glyph occupies 0x05 bytes as seen in table 5.1.2 above, and the offset is 0x00 0x0D, the offset of the second entry will be 0x00 0x12 and the width of the glyph is 0x03.

Calculate the third entry the same way as the second to get table 9 below.

Table 9: Character Table

	High Offset (MSB)	Low Offset (LSB)	Character Width
h	0x00	0x0D	0x05
i	0x00	0x12	0x03
j	0x00	0x15	0x04

Once completed, place the character table after the header and the character data aat the end, as seen in *table 10*.

Table 10: Sample Font File

0x05	0x07	0x49	0x4B	0x00	0x0D	0x05	0x00
0x12	0x03	0x00	0x15	0x04	0x84	0x2D	0x98
0xC6	0x20	0x43	0x24	0x84	0x2D	0x98	0x19
0x60							

Red = **Header**

Blue = Character Table

Purple = Character Data

5.2 Uploading a Font File

Syntax Hexadecimal 0xFE 0x24 [refID] [size] [data]

Decimal 254 36 [refID] [size] [data] ASCII 254 "\$" [refID] [size] [data]

Parameters

Parameter	Length	Description
refID	1	A unique font identification
		number.
size	2	Font file size (LSB to MSB).
data	X	Font file data.

Description In order to upload a font to the GLC24064 you must first initiate the

upload font file command (0xFE 0x24), you must then pass it a reference identification number, which must be unique for every font on the display module. You may then pass the display module the two byte file size, which needs to be transferred LSB, then MSB. The last part of uploading

a font is transmitting the font file data.

For detailed instructions on uploading a file to the GLC24064 see Sec-

tion 11.1 on page 44.

Remembered Always

5.3 Setting the Current Font

Syntax Hexadecimal 0xFE 0x31 [refID]

Decimal 254 49 [refID] ASCII 254 "1" [refID]

Parameters Parameter Length Description
refID 1 A unique font identification

number.

Description

In order to set the font on the GLK240128-25 you must know the font identification number of the font that you wish to use. The font ID is established when the font is saved to the display. The default installed fonts are "Small Filled" and "Futura Bk BT 16" and their font ID's are 0x01 and 0x02 respectfully, with "Small Filled" being the default selected font. Once you are aware of the font ID for the font that you wish you use, simply send the command bytes (0xFE 0x31) and then send the font ID corresponding to the font. A directory listing of the contents of the entire filesystem may be obtained by using the "Get Filesystem Directory" command, see Section 11.5 on page 47 for more detailed information.

Remembered Yes

5.4 Font Metrics

Syntax	Hexadecimal	0xFE 0x32 [lm] [tm] [csp] [lsp] [srow]
•	Decimal	254 50 [lm] [tm] [csp] [lsp] [srow]
	ASCII	254 "2" [lm] [tm] [csp] [lsp] [srow]

Parameters

Parameter	Length	Description
lm	1	Left margin: Location in pixels.
tm	1	Top margin: Location in pixels.
csp	1	Character Spacing: Amount of
		space in pixels between characters.
lsp	1	Line Spacing: Amount of space
		between lines in pixels.
srow	1	Scroll Row: The Y location of the
		last row in pixels.

Description

Font metrics define where the characters are positioned on the screen, by setting where the rows and columns begin based on the [lm][tm][csp][lsp][srow] parameters. [lm] defines the leftmost position and [tm] the topmost. [csp] controls the amount of pixels that are placed in between characters and [lsp] controls the amount of pixels that are placed in between lines. [srow] is the location of the top of the last row that will be displayed on the GLC24064. It defines the row that, when filled, will cause the display to auto scroll if auto scrolling is enabled. The font metrics will have to be reconfigured after changing to a different font.

Remembered Yes

5.5 Set Box Space Mode

Syntax Hexadecimal 0xFE 0xAC [value]

Decimal 254 172 [value]

Parameters Parameter Length Description

value 1 Value (0: Off, 1: On)

Description This command will toggle the box space mode. Box space mode is when

a box, the size of the character to be written, is printed to the display

before a character is written.

Remembered Yes

Factory Default Off

6 Text

6.1 Introduction

The GLC24064 is an intelligent display module, designed to reduce the amount of code necessary to begin displaying data. This means that it is able to display all characters and strings that are sent to it, which are defined in the current font, without much, if any configuration. The display module will begin displaying text at the top left corner of the display area, known as home, and continue to print to the display as if it was a page on a typewriter. When the text reaches the bottom right, as defined in the font metrics, it will automatically scroll all of the lines up and continue to display text.

6.2 Move Cursor Home

Syntax Hexadecimal 0xFE 0x48

Decimal 254 72 ASCII 254 "H"

Description This command moves the text insertion point to the top left of the display

area, based on the current font metrics see Section 5.4 on the preceding

page.

Remembered No

Setting the Cursor Position 6.3

Hexadecimal 0xFE 0x47 [col] [row] Syntax

> Decimal 254 71 [col] [row] **ASCII** 254 "G" [col] [row]

Parameters Parameter Length Description

1 Column col 1 row Row

Description This command sets the text insertion point to the [col] and [row] speci-

> fied. The insertion point is positioned using the base size of the current font (this command does not position the insertion point at a specific pixel). The column used is determined by multiplying the width of the widest character in the font by the [column]. The row used is determined by multiplying the height of the font by [row + Metrics: line spacing].

Remembered No

Setting the Cursor Coordinate

Syntax Hexadecimal 0xFE 0x79 [x] [y]

Parameter

Decimal 254 121 [x] [y] **ASCII** 254 "y" [x] [y]

Parameters Length Description The horizontal position in pixels. X

1 y The vertical position in pixels.

Description This command positions the insertion point at a specific pixel (X,Y),

which references the top left corner of the font insertion point.

Remembered No

Auto Scroll On

Syntax Hexadecimal 0xFE 0x51

Decimal 254 81 ASCII 254 "Q"

Description When auto scrolling is on, it causes the display to shift the entire display's

contents up to make room for a new line of text when the text reaches the end of the scroll row defined in the font metrics (the bottom right

character position) see Section 5.4 on page 24.

Remembered Yes

Factory Default On

6.6 Auto Scroll Off

Syntax Hexadecimal 0xFE 0x52

Decimal 254 82 ASCII 254 "R"

Description When auto scrolling is disabled, text will wrap to the top left corner of

the display area when the text reaches the end of the scroll row defined in the font metrics (the bottom right character position) see *Section 5.4 on page 24*. Existing text in the display area is not erased before new text is placed. A series of spaces followed by a "Cursor Home" command may

be used to erase the top line of text.

Remembered Yes

7 Bitmaps

7.1 Introduction

One of the main features of the GLC24064 is its ability to display bitmap images, that are either loaded onto its on board memory, or written directly to the screen. This chapter will cover creating a bitmap,

uploading the bitmap, as well as drawing the bitmap from memory and directly.

7.2 **Uploading a Bitmap File**

Syntax	Hexadecimal	0xFE 0x5E [refID] [size] [data]
•	Decimal	254 94 [refID] [size] [data]
	ASCII	254 "^" [refID] [size] [data]

Parameters	Parameter	Length	Description
	refID	1	A unique bitmap identification
			number.
	size	2	Bitmap file size (LSB to MSB).
	data	X	Bitmap data.

The GLC24064 is capable of storing up to sixty-four font and bitmap files combined, or 128 Kbytes which ever comes first. In order to upload a bitmap to the GLC24064 you must first initiate the upload font file command (0xFE 0x5E), you must then pass it a reference identification number, which must be unique for every font on the display module. You may then pass the display module the two byte file size, which needs to be transfered LSB, then MSB. The last part of uploading a bitmap is transmitting the bitmap file data.

For detailed instructions on uploading a file to the GLC24064 see Sec-

tion 11.1 on page 44.

Remembered Always

Description

Drawing a Bitmap from Memory 7.3

Hexadecimal	0xFE 0x62 [refID] [X] [Y]
Decimal	254 98 [refID] [X] [Y]
ASCII	254 "b" [refID] [X] [Y]
	Decimal

Parameters	Parameter	Length	Description
	refID	1	The bitmap identification number.
	X	1	Left bounds.
	Y	1	Top bounds.

Description This command will draw a bitmap that is located in the on board memory.

The bitmap is referenced by the bitmaps reference identification number, which is established when the bitmap is uploaded to the display module. The bitmap will be drawn beginning at the top left, from the specified X,Y coordinates. A directory listing of the contents of the entire filesystem may be obtained by using the "Get Filesystem Directory" command,

see Section 11.5 on page 47 for more detailed information.

Remembered No

7.4 Drawing a Bitmap Directly

Syntax Hexadecimal 0xFE 0x64 [X] [Y] [W] [H] [D]
Decimal 254 100 [X] [Y] [W] [H] [D]

ASCII 254 "d" [X] [Y] [W] [H] [D]

Parameters

Parameter	Length	Description
X	1	Left bounds.
Y	1	Top bounds.
W	1	Width
H	1	Height
D	1	Data

Description

Drawing a bitmap to the GLC24064, without first uploading the image to the memory can be a very useful feature for drawing images that are not used very often. In order to accomplish this, you must supply the display module with the X,Y coordinates, representing the top left corner of where you would like to draw the bitmap on the screen, as well as the width and the height of the bitmap. After you have supplied this data you may then upload the bitmap data to the GLC24064. The bitmap data is encoded into bytes horizontally and is transferred the same as if you were uploading a file, see *Section 11.1 on page 44* for more information about transferring data to the display module.

NOTE Drawing a bitmap directly to the display supports flow control.

Remembered No

8 Bar Graphs and Drawing

8.1 Introduction

Supplementary to the ability of the GLC24064 to display bitmaps and fonts, the GLC24064 also allows for a robust 2D drawing environment. With the ability to draw by pixel, line or rectangle, as well as the ability to continue a line to form a polygon, we are certain that you will spend less time, developing and creating better looking projects. With the addition of custom bar and strip graphs, you are sure to find the right tools to make any graphical layout a success.

8.2 Set Drawing Color

Syntax	Hexadecimal Decimal ASCII	0xFE 0x63 [color] 254 99 [color] 254 "c" [color]	or]
Parameters	Parameter	Length	Description
	color	1	Drawing color (0: White, 1-255:
			Black).
Description	This command s	sets the drawing c	olor for subsequent graphic commands
	that do not have	the duerring colo	managad as a manamatan Tha manamatan

that do not have the drawing color passed as a parameter. The parameter [color] is the value of the color where white is 0 and black is 1-255.

Remembered No

8.3 Draw Pixel

Syntax	Hexadecimal	0xFE 0x70 [x]	[y]
	Decimal	254 112 [x] [y]	
	ASCII	254 "p" [x] [y]	
Parameters	Parameter	Length	Description
	X	1	X screen location.
	y	1	Y screen location.
Description	This command will draw a pixel at (x,y) using the current drawing color		
	-	-	s fast enough to keep up with a steady ol is not required.

8.4 Drawing a Line

Syntax	Hexadecimal	0xFE 0x6C [x1] [y1] [x2] [y2	
	Decimal	254 108 [x1] [y1] [x2] [y2]	
	ASCII	254 "l" [x1] [y1] [x2] [y2]	

Parameters	Parameter	Length	Description	
	x1	1	Left bounds.	
	y1	1	Top Bounds.	
	x2	1	Right Bounds.	
	v2	1	Bottom Bounds.	

Description This command will draw a line from (x1,y1) to (x2,y2) using the current drawing color. Lines may be drawn from any part of the display to any other part. However, it may be important to note that the line may interpolate differently right to left, or left to right. This means that a line drawn in white from right to left may not fully erase the same line drawn

in black from left to right.

Remembered No

8.5 Continue a Line

Syntax	Hexadecimal	0xFE 0x65 [x] [y]	
	Decimal	254 101 [x] [y]	
	ASCII	254 "e" [x] [y]	

Parameters	Parameter	Length	Description	
	X	1	Left bounds.	
	y	1	Top Bounds.	

Description This command will draw a line with the current drawing color from the

last line end (x2,y2) to (x,y). This command uses the global drawing

color.

Remembered No

8.6 Draw a Rectangle

Syntax	Hexadecimal	0xFE 0x72 [color] [x1] [y1] [x2] [y2]		
-	Decimal	254 114 [color] [x1] [y1] [x2] [y2]		
	ASCII	254 "r" [color]	[x1] [y1] [x2] [y2]	
Parameters	Parameter	Length	Description	
	color	1	Drawing color (0: White, 1-255:	
			Black).	
	x1	1	Left bounds.	
	y1	1	Top Bounds.	
	x2	1	Right Bounds.	
	y2	1	Bottom Bounds.	
Description	This command draws a rectangular box in the specified color (0: White, 1: Black). The top left corner is specified by $(x1,y1)$ and the bottom right corner by $(x2,y2)$.			

8.7 Drawing a Solid Rectangle

Remembered No

Syntax	Hexadecimal Decimal ASCII	0xFE 0x78 [color] [x1] [y1] [x2] [y2] 254 120 [color] [x1] [y1] [x2] [y2] 254 "x" [color] [x1] [y1] [x2] [y2]	
Parameters	Parameter	Length	Description
	color	1	Drawing color (0: White, 1-255:
			Black).
	x1	1	Left bounds.
	y1	1	Top Bounds.
	x2	1	Right Bounds.
	y2	1	Bottom Bounds.
•	This command draws a solid rectangle in the specified color (0: White, 1: Black). The top left corner is specified by $(x1,y1)$ and the bottom right corner by $(x2,y2)$. Since this command involves considerable processing overhead, we strongly recommend the use of flow control, particularly if the command is to be repeated frequently.		

8.8 Initializing a Bar Graph

Syntax	Hexadecimal	0xFE 0x67 [refID] [type] [x1] [y1] [x2] [y2]
	Decimal	254 103 [refID] [type] [x1] [y1] [x2] [y2]
	ASCII	254 "g" [refID] [type] [x1] [y1] [x2] [y2]

Parameters

Parameter	Length	Description
refID	1	Reference number
type	1	Type of bar graph.
x1	1	Left bounds.
y1	1	Top Bounds.
x2	1	Right Bounds.
v2	1	Bottom Bounds.

Description

This command initializes a bar graph referred to by number [reference number] of type [type] with size from (x1,y1) (top left) to (x2,y2) (bottom right). A maximum of 16 bar graphs with reference numbers from 0 to 15 can be initialized as:

[type]	Direction	Bar Start Point
0	Vertical	Bottom
1	Horizontal	Left
2	Vertical	Тор
3	Horizontal	Right

The bar graphs may be located anywhere on the display, but if they overlap, they will not display properly.

It is important that [x1] is less than [x2], and [y1] is less than [y2]. This command doesn't actually draw the graph, it must be filled in using the Fill Bar Graph command. The unit saves time by only drawing that part of the bar graph which has changed from the last write, so the representation on the screen may not survive a screen clear or other corrupting action. A write of value zero, followed by new values will restore the proper look of the bar graph.

Remembered No

8.9 Drawing a Bar Graph

Syntax	Hexadecimal	0xFE 0x69 [ref] [value]		
-	Decimal	254 105 [ref] [value]		
	ASCII	254 "i" [ref] [value]		

Parameters Parameter Length Description ref 1 Initialized bar graph reference number. value 1 The number of pixels to fill.

Description Once the bar graph has been initialized it can be filled in using this com-

mand. This command sets the bar graph specified by the [ref] number to fill in [value]. [value] is given in pixels and should not exceed the available height/width of the graph. (If it does the graph will simply be

Right Bounds.

Bottom Bounds.

written to its maximum size.)

Remembered No

Initializing a Strip Chart 8.10

x2

y2

Syntax	Hexadecimal 0xFE 0x6A [refID] [x1] [y1] [x2] [y2] Decimal 254 106 [refID] [x1] [y1] [x2] [y2]				
			 		
	ASCII	254 "j" [refID] [x1] [y1] [x2] [y2]			
Parameters	Parameter	Length	Description		
	refID	1	Reference number		
	x1	1	Left bounds.		

1

Description

A strip chart is an area of the screen reserved for horizontal scrolling. This is normally used as follows:

- Initialize the strip chart, which reserves the appropriate area of the screen
- Draw a line segment at the right or left side of the strip chart.
- Shift the strip chart to the right or left.
- Draw the next line segment.
- Used this way the strip chart can produce a graph which scrolls smoothly horizontally in either direction. With text the strip chart can produce a marquis effect.

NOTE If the strip chart is used with text we recommend the use of a 6 or 7 pixel wide fixed width character set, with each character placed 8 pixels from the start of the previous one.

that has already been created.

Up to 7 strip charts ([ref] = 0 - 6) may be defined. To initialize a strip chart the user must define an area on the display in which to place the strip chart.(x1,y1) is the top left corner of the area to be used, where [x1] is the placement of the column where the strip chart is to begin and [y1] is the row. The user must then define [x2] as the bottom right column of the area to be utilized and [y2] as the bottom right row.

The definition of x must lie on byte boundaries. That is, x must be defined as 0x00, 0x08, 0x10, etc. This restriction does not apply to y values.

Remembered

Svntax

No

8.11 Shifting a Strip Chart

·	Decimal ASCII	254 107 [ref] 254 "k" [ref]	
Parameters	Parameter	Length	Description
	ref	1	Reference number of a strip chart

Hexadecimal 0xFE 0x6B [ref]

Description

This command shifts the strip chart left or right. [ref] determines both which strip chart is used and which direction it will shift. The direction is selected by the most significant bit (MSB):

MSB: 0 shifts leftMSB: 1 shifts right

For example if [ref] is 1:

254 107 1 (hex FE 6B 01) shifts left254 107 129 (hex FE 6B 81) shifts right

This command shifts the contents of the area defined in the Initialize Strip Chart command 8 pixels at a time.

Remembered No

9 Keypad

9.1 Introduction

The GLK240128-25 supports up to a twenty-five key, matrix style, keypad and may be configured to allow key presses to be automatically transmitted via RS-232 or polled through I²C. The GLK240128-25 also allows for auto-repeating key presses, and remapping of all keypad character codes.

9.2 Auto Transmit Key Presses On

Syntax Hexadecimal 0xFE 0x41

Decimal 254 65 ASCII 254 "A"

Description In this mode, all key presses are sent immediately to the host system

without the use of the poll keypad command. This is the default mode

on power up.

Remembered Yes

Factory Default On

9.3 Auto Transmit Key Presses Off

Syntax Hexadecimal 0xFE 0x4F

Decimal 254 79 ASCII 254 "O"

Description In this mode, up to 10 key presses are buffered until the unit is polled

by the host system, via the poll keypad command 254 38. Issuing this

command places the unit in polled mode.

Remembered Yes

9.4 Poll Key Press

Syntax Hexadecimal 0xFE 0x26

Decimal 254 38 ASCII 254 "&"

Description This command returns any buffered key presses via the RS-232 inter-

face. The host system must be set up to receive key codes. When the display receives this command, it will immediately return any buffered key presses which may have not been read already. If there is more than one key press buffered, then the high order bit (MSB) of the returned key code will be set (1). If this is the only buffered key press, then the MSB will be cleared (0). If there are no buffered key presses, then the returned code will be 0x00. Please note that to make use of this command, the

"Auto Transmit Key Presses" mode should be off.

Remembered No

9.5 Clear Key Buffer

Syntax Hexadecimal 0xFE 0x45

Decimal 254 69 ASCII 254 "E" Description This command clears any unread key presses. In a menu application, if

the user presses a key which changes the menu context, any following key presses may be inaccurate and can be cleared out of the buffer between menu changes to prevent jumping around the menu tree. It may also be used, in effect, to reset the keypad in case the host application

resets for whatever reason.

Remembered No

9.6 Set Debounce Time

Syntax Hexadecimal 0xFE 0x55 [time]

Decimal 254 85 [time] ASCII 254 "U" [time]

Parameters Parameter Length Description
time 1 Debounce time in increments of

6.554ms (0 - 255).

Description This command sets the time between key press and key read. All key

types with the exception of latched piezo switches will 'bounce' for a varying time, depending on their physical characteristics. The [time] value is in increments of 6.554ms. The default debounce time for the module is 8 (about 52ms), which is adequate for most membrane key-

pads.

Remembered Yes

Factory Default 8

9.7 Set Auto Repeat Mode

Syntax Hexadecimal 0xFE 0x7E [mode]

Decimal 254 126 [mode] ASCII 254 "~" [mode]

Parameters	Parameter	Length	Description
	mode	1	Auto Repeat Mode (0: Resend Key
			, 1: Key Up/Down)

Description

Two auto repeat modes are available and are set via the same command:

Resend Key Mode: 0x00Key Up/Down Mode: 0x01

Resend Key Mode This mode is similar to the action of a keyboard on a PC. In this mode, when a key is held down, the key code is transmitted immediately followed by a 1/2 second delay. After this delay, key codes will be sent via the RS-232 interface at a rate of about 5 codes per second. This mode has no effect if polling or if using the I²C interface.

Key Up/Down Mode This mode may be used when the typematic parameters of the "Resend Key Code" mode are unacceptable or if the unit is being operated in polled mode. The host system detects the press of a key and simulates an auto repeat inside the host system until the key release is detected. In this mode, when a key is held down, the key code is transmitted immediately and no other codes will be sent until the key is released. On the release of the key, the key release code transmitted will be a value equal to the key down code plus 20 hex.

Remembered Yes

Examples

When the key code associated with key 'P' (0x50) is pressed, the release code is 'p' (0x70). In RS-232 polled mode or via the I^2C , the "Key Down / Key Up" codes are used; however, the user should be careful of timing details. If the poll rate is slower than the simulated auto-repeat it is possible that polling for a key up code will be delayed long enough for an unwanted key repeat to be generated.

9.8 Auto Repeat Mode Off

Syntax Hexadecimal 0xFE 0x60
Decimal 254 96
ASCII 254 ""

Description This command turns auto repeat mode off. See Set Auto Repeat Mode.

9.9 Assign Keypad Codes

Syntax	Hexadecimal	0xFE 0xD5 [KDown] [KUp]
	Decimal	254 213 [KDown] [KUp]

Parameters	Parameter	Length	Description
	KDown	25	Key down codes
	KUp	25	Key up codes

Description

This command will allow you to reassign the key codes that correspond to the key presses on the matrix style key pad. The first twenty-five bytes that are transmitted will be used for the key down codes and the next twenty-five bytes that are transmitted will be used for the key up codes. The default values of the key down codes are 'A-Y' in order, and for the key up codes the values are 'a-y' in order.

	Key Down				Key Up					
	1	2	3	4	5		1	2	3	4
1	A	В	С	D	Е	1	a	b	С	d
2	F	G	Н	I	J	2	f	g	h	i
3	K	L	M	N	О	3	k	1	m	n
4	P	Q	R	S	T	4	p	q	r	S

10 Display Functions

10.1 Introduction

The GLC24064 employs software controlled display settings, which allow for control over, clearing the screen, changing the brightness and contrast or setting timers for turning it on or off. The combination of these allow you complete software control over your display's appearance.

10.2 Clear Screen

Syntax Hexadecimal 0xFE 0x58

Decimal 254 88 ASCII 254 "X"

Description This command clears the display and resets the text insertion position to

the top left position of the screen defined in the font metrics.

Remembered No

10.3 Backlight On

Syntax Hexadecimal 0xFE 0x42 [min]

Decimal 254 66 [min] ASCII 254 "B" [min]

Parameters Parameter Length Description

min 1 Minutes before turning the backlight on (0 to 100).

Description This command turns the backlight on after the [minutes] timer has ex-

pired, with a one-hundred minute maximum timer. A time of 0 specifies that the display should turn on immediately and stay on. When this command is sent while the remember function is on, the timer will reset and

begin after power up.

Remembered Yes

Factory Default 0

10.4 Backlight Off

Syntax Hexadecimal 0xFE 0x46

Decimal 254 70 ASCII 254 "F"

Description This command turns the backlight off immediately. The backlight will

remain off until a 'Backlight On' command has been received.

Remembered YesDrawing a bitmap to the GLC24064, without first uploading the

10.5 Set Backlight Brightness

Syntax Hexadecimal 0xFE 0x99 [brightness]

Decimal 254 153 [brightness]

Parameters Parameter Length Description

brightness 1 Backlight setting (0 to 255).

Description This command sets the backlight settings according to [backlight]. If the

remember function is on, this command acts the same as 'Set and Save

Backlight Brightness'.

Remembered Yes

Factory Default 255

10.6 Set and Save Backlight Brightness

Syntax Hexadecimal 0xFE 0x98 [brightness]

Decimal 254 152 [brightness]

Parameters Parameter Length Description

brightness 1 Backlight setting (0 to 255).

Description This command sets and saves the backlight [brightness] as default.

Remembered Always

10.7 Set Contrast

Syntax Hexadecimal 0xFE 0x50 [contrast]

Decimal 254 80 [contrast] ASCII 254 "P" [contrast]

Description This command sets the display's contrast to [contrast], where [contrast] is

a value between 0x00 and 0xFF (between 0 to 255). Lower values cause 'on' elements in the display area to appear lighter, while higher values cause 'on' elements to appear darker. Lighting and temperature conditions will affect the actual value used for optimal viewing. Individual display modules will also differ slightly from each other in appearance. In addition, values for optimal viewing while the display backlight is on

may differ from values used when backlight is off.

This command does not save the [contrast] value, and is lost after power down; but this command has the option of remembering the settings when issued with the Remember function 'on'. When this is the case,

this command is the same as the Set and Save Contrast command.

Remembered Yes

Factory Default 128

10.8 Set and Save Contrast

Syntax Hexadecimal 0xFE 0x91 [contrast]
Decimal 254 145 [contrast]

Decimal 25 1 15 [contrast]

Parameters Parameter Length Description

contrast 1 Contrast value (0 to 255).

Description

This command sets the display's contrast to [contrast], where [contrast] is a value between 0x00 and 0xFF (between 0 to 255). Lower values cause 'on' elements in the display area to appear lighter, while higher values cause 'on' elements to appear darker. Lighting conditions will affect the actual value used for optimal viewing. Individual display modules will also differ slightly from each other in appearance. In addition, values for optimal viewing while the display backlight is on may differ from values used when backlight is off.

NOTE This command saves the [contrast] value so that it is not lost after power down.

Remembered Yes

Factory Default 128

11 Filesystem

11.1 Introduction

The GLK240128-25 incorporates a 128 Kbyte on board flash memory in order to allow font and bitmap files to be transfered directly onto the display and recalled whenever necessary. The filesystem can address up to sixty-four font and bitmap files combined, or 128 Kbytes which ever comes first. This section covers uploading, downloading, deleting and moving files, as well as getting the remaining space or wiping the filesystem.

11.1.1 File Upload Protocol

In order to allow fonts and bitmaps to be uploaded to the on board flash memory Matrix Orbital has developed a simple protocol that supports RS-232/TTL or I²C communications. In order to begin a file transmission the first step will be to provide the display module with the appropriate command bytes, meaning the command prefix, 0xFE, followed by the command number, 0x24 for a font file, or 0x5E for a bitmap file. This will begin the file transfer sequence. The next step will be to request a reference identification number (ref ID) which will allow you to identify the file for future use. Reference ID numbers can be any byte between 0x01 and 0xFF, however each ID must be unique. Once you have transmitted the refID, the display module will immediately echo the byte if the ID is not in use, however if the ID is in use it will decline the ID by sending a decline byte, 0x08, and terminate the session. Once you have received confirmation that the refID is not in use, you may then confirm the echo by sending a confirm byte, 0x01, or report a byte error by sending a decline byte, 0x08, this will will terminate the session.

The next part of uploading a font file is to provide the display module with the two byte file size of the

data that you wish to transfer, LSB to MSB. The LSB must be transmitted first and will be echoed by the module. You must confirm the echo with a 0x01, or report a byte error by sending a decline byte, 0x08. Second you may transfer the MSB, after receiving the MSB the display module will echo the byte and then send a confirm, 0x01, if the file fits, or decline byte, 0x08 and terminate the session.

Byte	Description
0x01	Confirm: Will continue the file transfer.
0x08	Decline: Terminate the session.

The last part of uploading a font file is to upload the file data. After transmitting each byte of the file the module will echo the byte and wait for a confirmation byte of 0x01 until the file has completed uploading. Below is an example of uploading the font file which we created in **Section 5.1.2 on page 21**.

```
Transmit(0xFE); //Command Prefix
Host:
         Transmit(0x24); //Font file upload command
         Transmit(0x03); //Request file ID for font file
Module: Echo(0x03);
                        //Accept request for file ID, by echoing the request
Host:
        Receive();
                        //Receive the echo
         Confirm(0x01); //Confirm File ID
         Transmit(0x19); //Transmit the file size LSB
Module:
        Echo(0x19);
                        //Echo the LSB
         File Size = 0x19
         Receive();
                        //Receive LSB echo
Host:
         Confirm(0x01); //Confirm the LSB
         Transmit(0x00); //Transmit MSB
        Echo(0x00);
                        //Echo MSB
Module:
         FileFits(0x01); //Send confirmation that the file fits
Host:
        Receive();
                        //Receive confirmation
         Transmit(0x05); //Begin transmit of file data
Module: Echo(0x05);
                         //Echo first byte from file
Host:
        Receive();
                        //Receive echo
         Confirm(0x01); //Confirm echo
         Transmit(0x07); //Transmit second byte of file data
etc...
```

NOTES

- The GLC24064 has watch dog timer, set to 2.1 seconds in between transmissions, in order prevent the display module from staying in a waiting state.
- Once the timeout has been reached the timer will reset the display and issue a 0xFE 0xD4 response to the host to signal that this has happened.

11.2 Wipe Filesystem

Syntax Hexadecimal 0xFE 0x21 0x59 0x21

Decimal 254 33 89 33 ASCII 254 "!" "Y" "!"

Description This command completely erases the display's non-volatile memory. It

removes all fonts, font metrics, bitmaps, and settings (current font, cursor position, communication speed, etc.). It is an "odd" command in that it

is three bytes in length in order to prevent accidental execution.

Remembered Yes

11.3 Deleting a File

Syntax Hexadecimal 0xFE 0xAD [type] [refID]
Decimal 254 173 [type] [refID]

Parameters Length Description
type 1 Type of file (0:Font, 1:Bitmap)
refID 1 Reference ID of the file to delete.

Description This command erases a single file at a time within the GLC24064 mem-

ory when given two parameters: [type] and [ref]. The file type and reference number are defined when the file is saved to the GLC24064.

[type] = 1: Bitmap [type] = 0: Font

Remembered Yes

11.4 Get Filesystem Space

Syntax Hexadecimal 0xFE 0xAF

Decimal 254 175

Description This command will return 4 bytes, LSB to MSB for how many bytes are

remaining in the 16 KB on board memory.

Remembered No

11.5 Get Filesystem Directory

Syntax Hexadecimal 0xFE 0xB3

Decimal 254 179

Description This command will return a directory of the contents of the file system.

The first byte returned will be a hex value representing the number of entries in the filesystem, followed by four bytes for each entry. See the

following tables:

	Filesystem Header
Bytes	Description
1	Hex value representing the number
	of entries in the filesystem
	File Entry
Bytes	Description
1	Flag: Hex value of 0x00 indicates
	that this file entry has not been used.
1	FileID/Type: 1st bit is the file type
	(0: Font, 1: Bitmap). Next 7 bits are
	the file ID.
1	File Size: LSB
1	File Size: MSB

Remembered No

11.6 Downloading a File

Syntax Hexadecimal 0xFE 0xB2 [Type] [refID]

Decimal 254 178 [Type] [refID]

Parameters Length Description

Type 1 File type (0:Font File, 1:Bitmap)
refID 1 Reference ID number

Description Download a specified file from the filesystem. The first 4 bytes will be

the length of the file (LSB to MSB) followed by the data contained in the

file.

Remembered No

11.7 Moving a File

Syntax Hexadecimal 0xFE 0xB4 [oldT] [oldID] [newT] [newID]

Decimal 254 180 [oldT] [oldID] [newT] [newID]

Parameters Parameter Length Description oldT 1 Old file type

oldID 1 Old file ID
newT 1 New file type
newID 1 New file ID

Description This command can be used to move a file to a new file ID, or correct the

type of a file that was uploaded incorrectly. The command first checks to see if there is a file identified by [oldT] and [oldID]. If it does exist, and there is no file already with the desired type and ID, the ID and type of

the old file will be changed to [newT] and [newID] respectively.

Remembered Always

12 Data Security

12.1 Introduction

Ensuring that your GLC24064 display's exactly what you want it to can be the difference between a projects success and failure. This is why we incorporate features such as Data Lock into the GLC24064. With this new feature you now are in control over of how and when settings will be changed so there is no need to worry about the module acting exactly like you expected it to because all the settings may be locked and remembered for the next power up.

12.2 Set Remember

Syntax	Hexadecimal	0xFE 0x93 [switch]
	Decimal	254 147 [switch]

Parameters	Parameter	Length	Description
	switch	1	0: Do not remember, 1: Remember

Description This command allows you to switch the remember function on and off.

To use the remember function, set remember to on, then set all of the settings that you wish to save, settings that are listed as 'Remember:

Yes' support being saved into the non-volatile memory. After you have set all of the commands that you wish to save, you may then cycle the power and check the display settings to ensure that all the settings have been saved. If you wish to use remember again after cycling the power,

you must set it to on again.

NOTES

- Writing to non-volatile memory is time consuming and slows down the operation of the display.
- Non-volatile memory has a 'write limit' and may only be changed approximately 100,000 times.

Remembered No

Factory Default Do not remember

12.3 Data Lock

Syntax Hexadecimal 0xFE 0xCA [level]
Decimal 254 202 [level]

Parameters Length Description
level 1 Sets the data lock level

Description

Data lock, originally known as paranoia, allows you to lock the module from displaying information, as well as enables the protection of the filesystem and module settings. Each bit corresponds corresponds to a different lock level, while sending a zero will unlock your display as the

following tables explains:

Bit	Binary	Data Lock Level	Description
0	0	Unlock	Sending a zero will cause
			the display to unlock.
1-4	1-1111	Reserved	
5	10000	Setting Lock	Locks the display settings
			such as backlight, contrast
			and GPO settings.
6	100000	Filesystem Lock	When locked no bitmap or
			font files may be added,
			deleted or modified.
7	1000000	Command Lock	Locks all commands but
			the the data lock command.
8	10000000		

NOTES

• Sending a new data lock level will override the previous data lock level.

• Data lock levels may be combined.

Remembered Always

Factory Default 0

Examples

Hex	Dec	Binary	Description
0x00	0	0	Unlock
0xF0	240	11110000	Setting, Filesystem, Command and Display Lock
0x50	80	01010000	Setting and Command Lock

12.4 Set and Save Data Lock

Syntax Hexadecimal 0xFE 0xCB [level]

Decimal 254 203 [level]

Parameters Length Description
level 1 Sets the data lock level

Description This command will set and save the data lock level. See the Data Lock

section for more information.

Remembered Always

Factory Default 0

13 Miscellaneous

13.1 Introduction

This chapter covers the 'Report Version Number' and 'Read Module Type' commands. These commands can be particularly useful to find out more information about the display module before contacting technical support.

13.2 Read Version Number

Syntax Hexadecimal 0xFE 0x36

Decimal 254 54 ASCII 254 "6"

Description This command will return a byte representing the version of the module,

see the following table as an example:

Hex Value	Version Number
0x10	Version 1.0
0x20	Version 2.0
0x42	Version 4.2

Remembered No

13.3 Read Module Type

Syntax Hexadecimal 0xFE 0x37

Decimal 254 55 ASCII 254 "7" Description

This command will return a hex value corresponding to the model number of the module see the following table:

Hex	Product ID	Hex	Product ID
1	LCD0821	36	LK202-24-USB
2	LCD2021	37	VK202-24-USB
5	LCD2041	38	LK204-24-USB
6	LCD4021	39	VK204-24-USB

15 Appendix

15.1 Specifications

15.1.1 Environmental

Table 70: Environmental Specifications

	Standard Temperature	Extended Temperature
Operating Temperature	0°C to +50°C	-20°C to +70°C
Storage Temperature	-20°C to +70°C	-30°C to +80°C
Operating Relative Humidity	90% max non-condensing	
Vibration (Operating)	4.9 m/s ² XYZ directions	
Vibration (Non-Operating)	19.6 m/s ² XYZ directions	
Shock (Operating)	29.4 m/s ² XYZ directions	
Shock (Non-Operating)	490 m/s ² XYZ directions	

15.1.2 Electrical

Table 71: Electrical Specifications

	Standard	Wide Voltage (V)	
			Switching Power Supply
			(VPT)
Supply Voltage	+5Vdc ±0.25V	+9V to +15V	+9V to +35V
Backlight On	110 mA typical		
Backlight Off Supply	40 mA		
Power Conservation	35 mA		

15.2 Definitions

E Extended Temperature (-20C to 70C)

VPT Wide Voltage with Efficient Switching Power Supply (+9 to +35Vdc)

V Wide Voltage (+9 to +15Vdc)

GW Grey Text / White Background

WB White Text / Blue Background
