FCC Notice

This device complies with Part 15 of the FCC Rules and the Radio Interference Requirements of the Canadian Department of Communications. Operation is subject to the following conditions: (1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his own expense.

ORDERING INFORMATION

It is most important that the correct part number is used when ordering parts. Parts orders are machine processed, using only the part number and quantity as shown on the order. Orders are not edited to determine if the part number and description agree.

METTLER TOLEDO RESERVES THE RIGHT TO MAKE REFINEMENTS OR CHANGES WITHOUT NOTICE.

This manual describes the operation and functionality of the LYNX terminal containing software number D145828. The software number is displayed during the power-up sequence.

Precautions

Read this manual before operating or servicing this equipment.

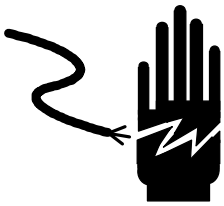
Always take proper precautions when handling static sensitive devices.

Do not connect or disconnect load cells or a scale base to the equipment with power connected or damage may result.

Always remove power and wait at least 30 seconds before disconnecting any cables. Failure to observe this precaution may result in damage to, or destruction of the equipment.

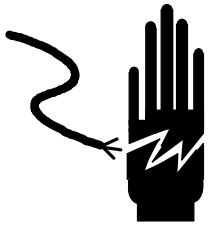
Save this manual for future reference.

Call METTLER TOLEDO for parts, information, and service.



WARNING

ONLY PERMIT QUALIFIED PERSONNEL TO SERVICE THIS EQUIPMENT. EXERCISE CARE WHEN MAKING CHECKS, TESTS AND ADJUSTMENTS THAT MUST BE MADE WITH POWER ON. FAILING TO OBSERVE THESE PRECAUTIONS CAN RESULT IN BODILY HARM AND/OR PROPERTY DAMAGE.

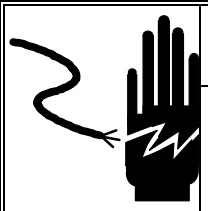


WARNING

DISCONNECT ALL POWER TO THIS UNIT BEFORE INSTALLING, SERVICING, CLEANING OR REMOVING THE FUSE. FAILURE TO DO SO COULD RESULT IN BODILY HARM AND/OR PROPERTY DAMAGE.

CAUTION

OBSERVE PRECAUTIONS FOR HANDLING ELECTROSTATIC SENSITIVE DEVICES.



WARNING

FOR CONTINUED PROTECTION AGAINST SHOCK HAZARD, CONNECT TO PROPERLY GROUNDED OUTLET ONLY. DO NOT REMOVE THE GROUND PRONG.

CAUTION

BEFORE CONNECTING OR DISCONNECTING ANY INTERNAL ELECTRONIC COMPONENTS OR INTERCONNECTING WIRING BETWEEN ELECTRONIC EQUIPMENT, ALWAYS REMOVE POWER AND WAIT AT LEAST THIRTY (30) SECONDS BEFORE ANY CONNECTIONS OR DISCONNECTIONS ARE MADE. FAILURE TO OBSERVE THESE PRECAUTIONS COULD RESULT IN DAMAGE TO OR DESTRUCTION OF THE EQUIPMENT, OR BODILY HARM.

Click on the blue boxes to go to the desired chapters.

CONTENTS

1 Introduction

This manual provides information for installing, programming, and servicing the LYNX scale terminal, a flexible, high performance terminal designed for use in applications requiring dynamic weighing, weight accumulation, automatic filling, prompting an operator for sequencing, storing tare weights, and more. Information on operating the LYNX terminal is also provided in the **LYNX Scale Terminal User's Guide**.

Review all instructions and safety precautions provided in this manual carefully. Installation and service procedures should be performed only by authorized personnel.

If you discover a problem with the information provided, please complete and return the Publication Evaluation Form found in the back of this manual. If you encounter problems not covered in this manual, please contact your local authorized Mettler Toledo representative.

Inspection and Contents Checklist

If you are responsible for installing the LYNX terminal, follow the procedures listed here.

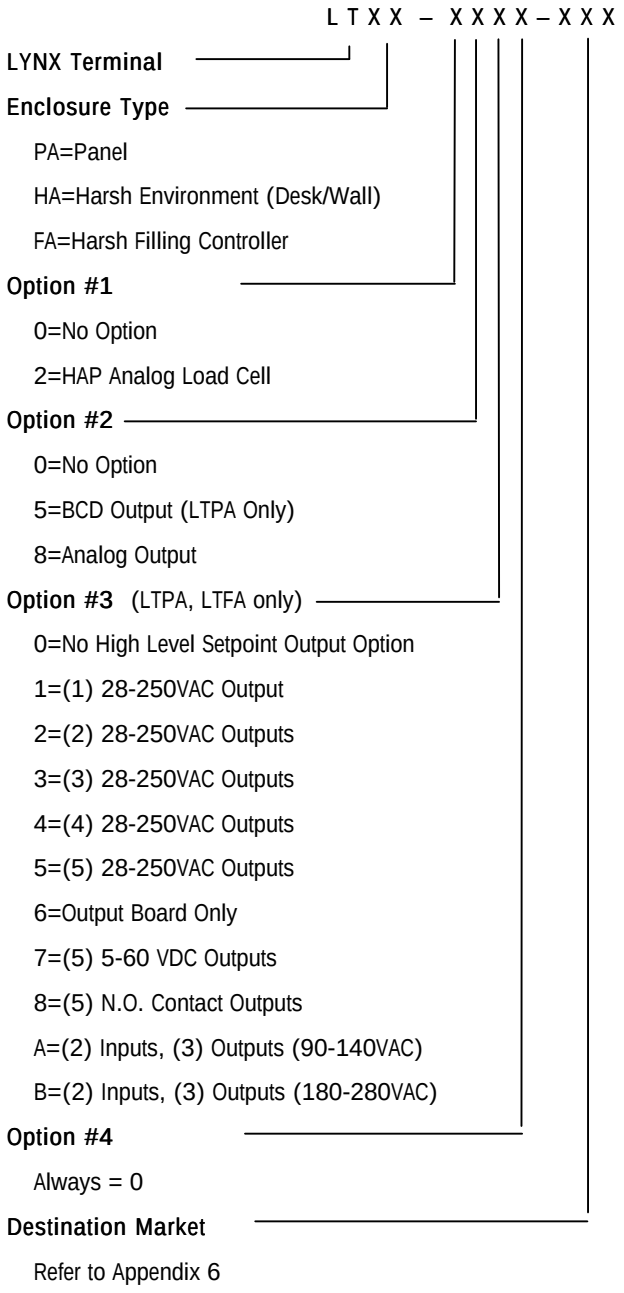
1. If the LYNX terminal's shipping container appears damaged upon delivery, check inside for damage. File a freight claim with the carrier if necessary.
2. If the container was undamaged, unpack the container if you have not already done so. Keep the original packing materials for future use.
3. Make sure the LYNX terminal package contains the following:
   - LYNX terminal
   - Screwdriver
   - Set of capacity labels
   - User's Guide
   - Ferrite Ring for DigiTOL scales

   In addition, the panel mount version of the LYNX includes:
   - Three nylon cable ties
   - 2 mm hex key
   - Weights and measures sealing screws

If any materials are missing or damaged, please contact your authorized Mettler Toledo representative immediately.

Model Identification

The LYNX terminal is available in three models. The stainless steel harsh environment model (desk/wall) is suitable for use on a desktop or other flat surface, or can be mounted on a wall using the same mounting bracket used for desktop applications. The panel mount unit can be mounted through a flat panel using two integral brackets. The harsh environment filling controller is a special self-contained configuration for filling control applications. Use the information below to confirm the correct model number for the LYNX terminal with which you will be working. The model number is found on the data plate on the side of the LYNX terminal.



Physical Dimensions

The physical dimensions of the LYNX panel mount model are as follows:

- 10.06 in. (255 mm) × 5.6 in. (142 mm) at the front of the terminal
- 9.5 in. (241 mm) × 4.91 in. (125 mm) at the rear
- 6.46in. (164 mm) deep behind the panel

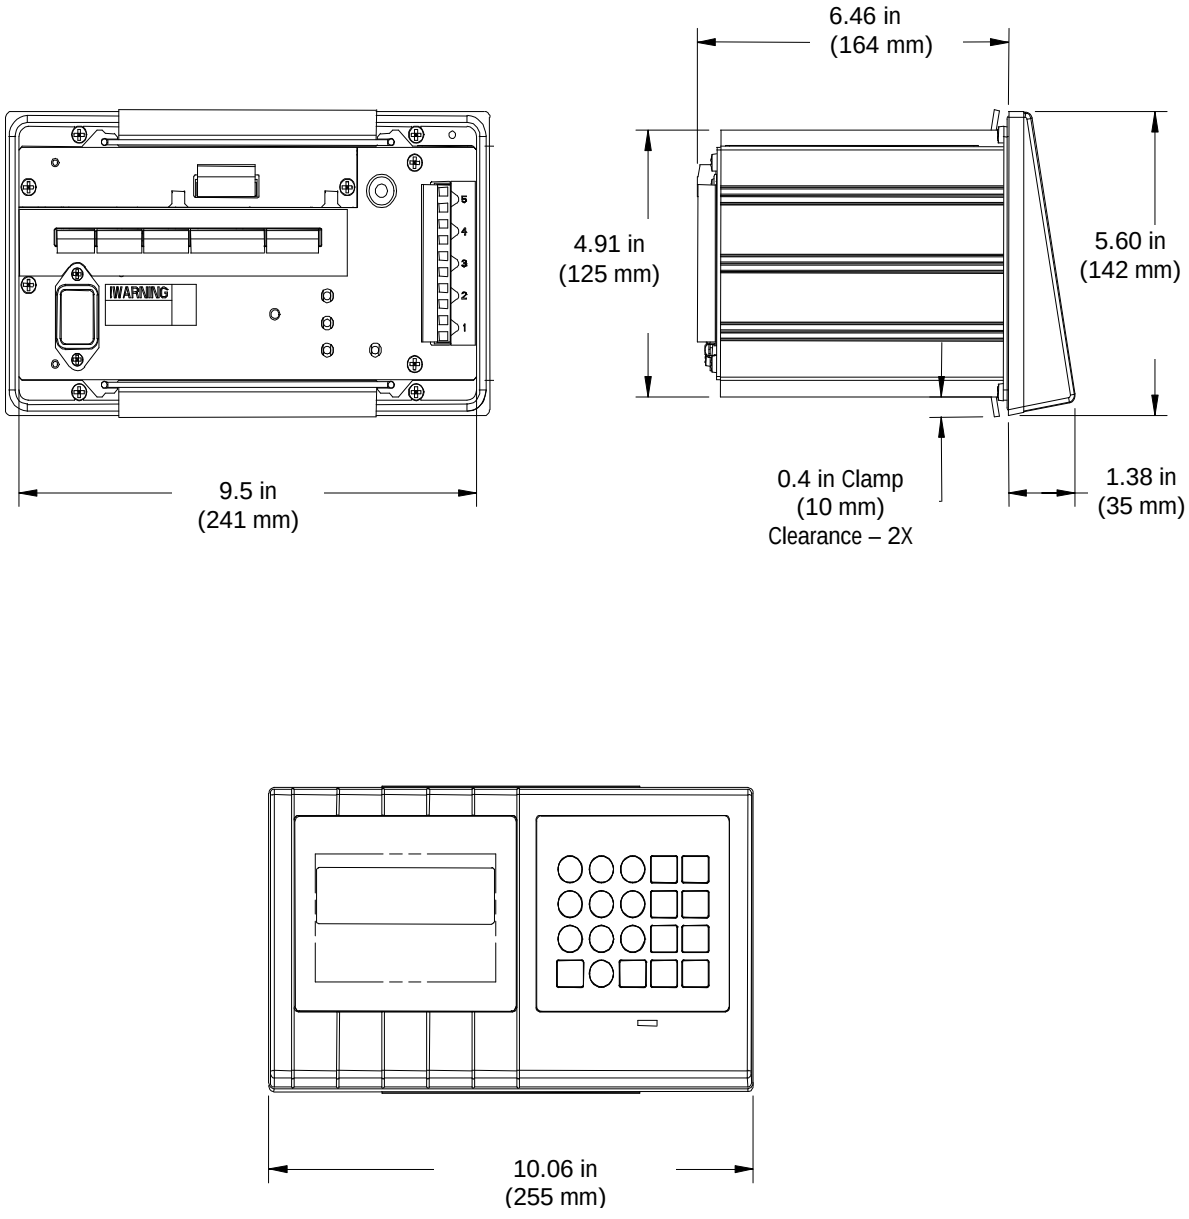


Figure 1-1 LYNX Panel Mount Dimensions

The harsh environment LYNX terminal measures:

- 10.00 in (254 mm) x 7.00 in (178 mm) at the front of the terminal
- 3.22 in (82 mm) deep

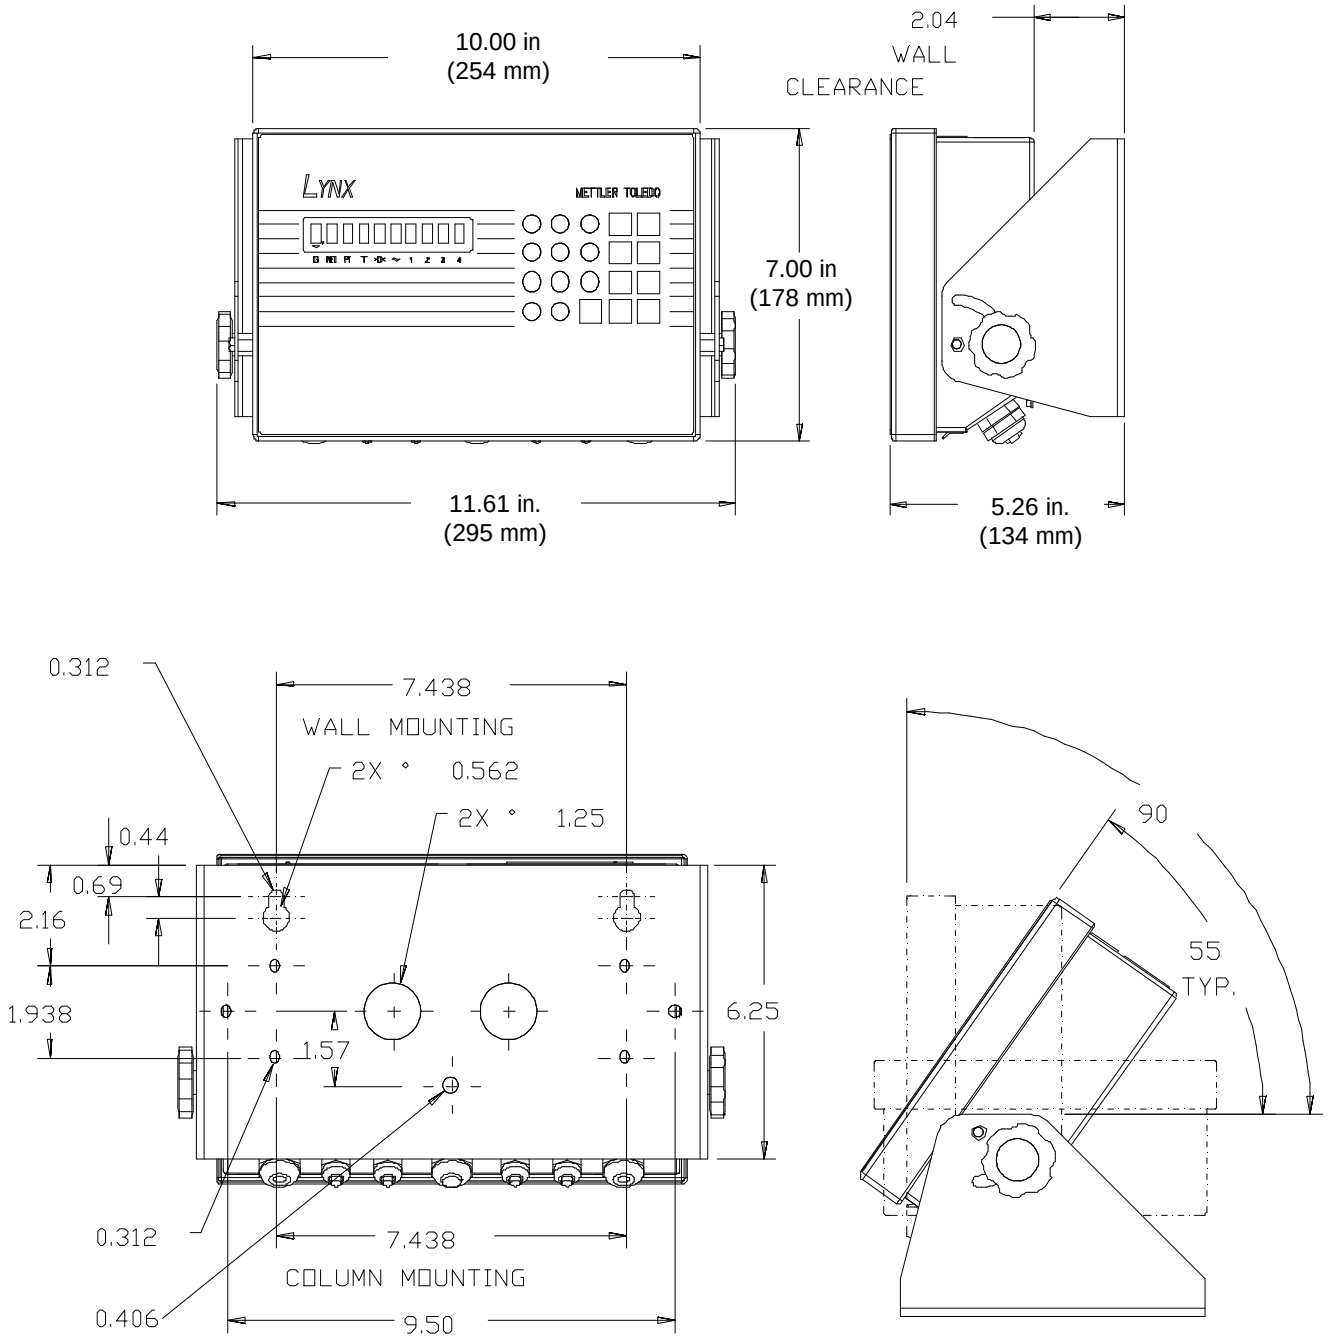

Figure 1-2 LYNX Harsh Environment (Desk/Wall) Dimensions

The harsh environment Lynx Filling Controller measures:

- 11.12 in (282 mm) x 9.42 in. (239 mm) at the front of the controller
- 9.62 (244 mm) deep (including wall mount brackets)

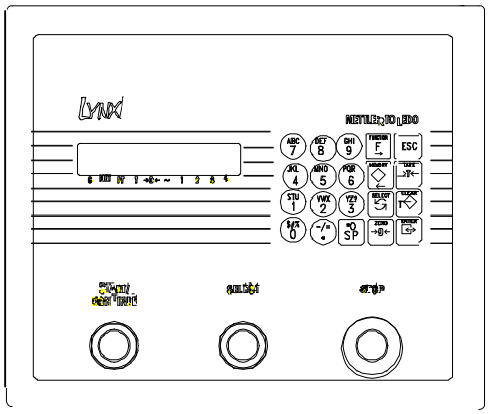

Figure 1-3: Lynx Harsh Environment Filling Controller

Specifications

Model	Harsh Environment Enclosure	Panel Mount Enclosure	Harsh Environment Filling Controller
Dimensions	• 10.00 in (254 mm) x 7.00 in (178 mm) at the front of the terminal • 3.22 in (82 mm) deep	• 10.06 in. (255 mm) × 5.6 in. (14.2 mm) at front • 9.5 in. (241 mm) × 4.91 in. (125 mm) at rear • 6.46 in. (164 mm) behind panel	• 11.12 in (282 mm) x 9.42 in. (239 mm) at the front of the controller • 9.62 (244 mm) deep (including wall mount brackets)
Construction	NEMA4x, IP65 brushed stainless steel (type 304)	NEMA4, IP65 front panel; NEMA1, IP30 behind the panel	NEMA4x, IP65 brushed stainless steel (type 304)
Shipping Weight	12 lb (5.5 kg)	11 lb (4.9 kg)	21 lb (9.4 kg)
Power	Power and power cord according to destination market code 100/120 VAC (85-132 VAC) or 220/240 VAC (180-264 VAC); 49-63 Hz; 12 watts maximum		
Operating Temperature	14°F to 113°F (-10°C to 45°C); 10-95% relative humidity, non-condensing		
Display	10-character, alphanumeric, vacuum fluorescent, 0.44 in (11mm) high; Updated 10 times per second		
Keypad	20-key, numeric, function, and alphanumeric input, polyester construction		
Scale Performance	• 500 to 100,000 scale divisions capacity • 0.00001 to 200 division size • Count-by 1, 2 or 5 • 2 million internal counts for analog load cell scales	• 9 calibration engineering units of measure • 9 secondary engineering units of measure and custom units • Push button, preset, stored, and automatic tare	
Scale Interface	• Safe area analog load cells, maximum 8 x 350Ω; 2 or 3 mV/V selection • DigiTOL® load cell scales and junction box	• Hazardous area analog load cells when used with optional barrier	
Scale Update Rate	• Analog load cells at 20 updates per second	• DigiTOL load cells at 4-12 updates per second	
TraxDSP® Filtering	• 100% digital filtering with software tuning • Analog and DigiTOL low pass and stability filters	• Analog notch filter • Automatic filter tuning algorithm	

Model	Harsh Environment Enclosure	Panel Mount Enclosure	Harsh Environment Filling Controller
Discrete Outputs	• 5 low level, open-collector, 5-24 VDC outputs standard	• Programmable as 1- or 2-speed setpoints with preact, zero tolerance, setpoint tolerance, 1- or 2-speed feed control with preact, discharge control, motion, net mode, center of zero, under zero, over capacity	
Discrete Inputs	• 3 low level, ground true, 0-24 VDC inputs standard	• Programmable as tare, clear, zero, print, switch units, blank display, start dynamic weighing, inhibit key-board, x10 weight display, display accumulator total, OK to feed, OK to discharge, advance prompt list	
Serial Interface	• Continuous, Demand and Bi-directional Host Protocols • 300-38.4k baud, 7 or 8 data bits, 1 or 2 (COM2 and 3) stop bits	• Selectable parity, checksum, Xon/Xoff flow control • COM1 – RS-233 and RS-485 • COM2 – RS-232 and 20mA Current Loop • COM3 – RS-422 and DigiTOL load cell	
Memory	• Flash downloadable program memory • Removable EEPROM for calibration data • Battery-backed RAM and battery-backed, Y2K-compliant, time and date with multiple formats • 20 item prompt list for operator, process sequencing	• 20 user programmable, 40-character literal print messages • Consecutive numbering for print output serialization • Sub-total and total accumulators • 99 ID memory records for tare and/or accumulation • 4k bytes transaction record data storage	
Approvals	• UL (Underwriters Laboratories) per UL1950 • cUL (Canadian) per CSA 22.2 #950 • CE (European) Low Voltage Directive	• U.S. Weights and Measures Class III and IIIL NTEP Certificate of Conformance Number 95-085 • CE (European, OIML) Weights and Measures approval up to 6000e, # T2206 • Approval for other markets available on request	
Options	• 4-20mA, 0-5VDC, 0-10VDC, 16 bit D/A analog output • 6 decade, BCD weight data output (panel mount) • Internal high-level, solid-state discrete output relays (panel mount)	• Hazardous area analog load cell barrier • X-purged enclosure for hazardous area locations • Accessories including cables, printers, remote displays	

Location/Environment

The first step in installing the LYNX terminal is to select a location for it that will enhance its longevity and operation. Keep in mind the following when choosing a location:

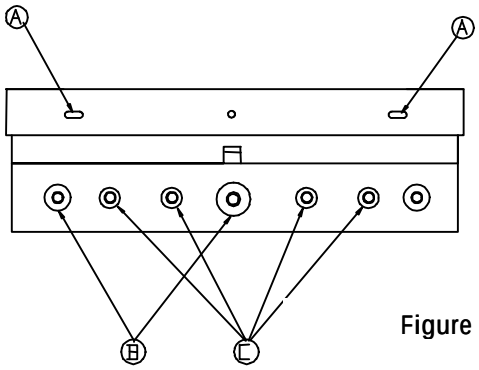
- The LYNX terminal can be operated between 14° F to 113° F (-10° C to 45° C) at 10% to 95% humidity, noncondensing.
- The harsh environment enclosures are designed to meet NEMA 4X (IP65) requirements for a dust-tight, splash-proof enclosure. On the panel mount enclosure, the front panel and panel clamping mechanism are designed to provide a NEMA 4 (IP65) seal. The rest of the panel mount enclosure meets NEMA 1 (IP30) requirements and provides no protection against dust or water ingress.
- **THE LYNX TERMINAL IS NOT INTRINSICALLY SAFE FOR SCALES!** A special model is available to operate Mettler Toledo barriers for scales located in a hazardous area. Contact your authorized Mettler Toledo representative for information about hazardous area applications.

Opening and Connecting the Harsh Environment Model

The harsh environment LYNX terminal uses four spring clips attached to the enclosure body to lock the front panel in place and to seal the enclosure to NEMA 4X specifications. To access the Controller PCB for internal wiring and setting switches:

1. Insert the tip of a flat-blade screwdriver into one of the two slots ("A" in Figure 1-1) located on the bottom of the front panel assembly and gently push straight in toward the enclosure. You should hear a quiet "pop" when the cover has been released.
2. Repeat for the other slot.
3. Lift the bottom of the front panel out until it completely clears the enclosure.
4. Squeeze the top of the front panel to the enclosure slightly and raise it to clear the two top clips. The cover will swing down hinged by two wire cables at the bottom.

Note that the harsh environment filling controller is opened and connected in a similar manner except that two mounting brackets are shipped loose for wall mounting.



Reference Letter	Suggested Cable
B	Analog and DigiTOL load cell wiring
C	Serial and discrete I/O cables

Figure 1-4

Be careful to select a cable grip to the terminal block you are wiring to keep the wiring neat and easy to connect.

To connect cabling to the unit:

1. Pass the cables that enter the enclosure through an appropriately sized cable grip **before** connecting the wires.
2. Tighten the cable grip sufficiently to provide a water-tight seal around the cable only after re-securing the cover. Continue to the section entitled Electrical Connections.

Installing the Panel Mount Model

Refer to Figure 1-5 and 1-6 (cutout diagram) and the instructions below to install the panel mount version of the LYNX terminal.

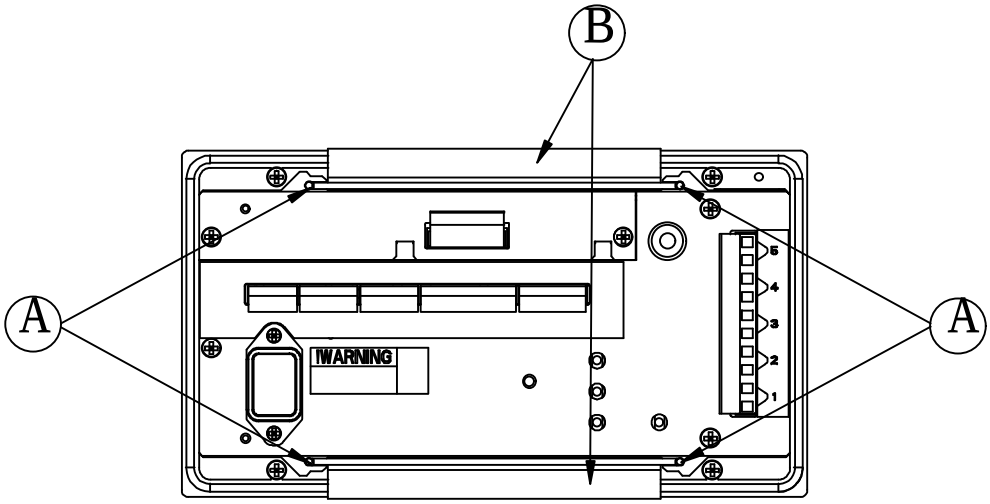


Figure 1-5: Panel Mount Installation

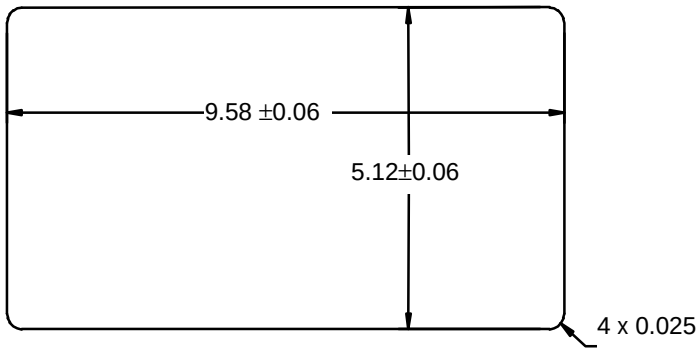

Figure 1-6 Cutout Diagram

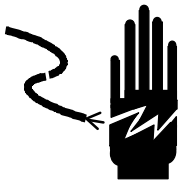
1. Cut an opening 9.54 in. (243 mm) wide × 5.08 in. (130 mm) high to accommodate the terminal. A template is included at the end of this manual to mark the panel cutout. The tolerance for the panel cutout is ± 0.06 in. (1.5 mm).
2. Using the Allen wrench included with the unit, remove the four retaining set screws (A) located at the rear of the enclosure in the top and bottom mounting plate grooves.
3. Remove both mounting plates (B).
4. Insert the terminal through the panel opening from the front until it is flush against the panel. Confirm that the terminal is installed right side up.

5. Slide the top and bottom mounting plates back in the grooves and push them flush against the panel from the back. The flared end of the plate should contact the back of the panel.
6. Holding the unit in place, replace the four set screws and tighten until the unit is secured and the front panel gasket is compressed.
7. Inspect the front of the LYNX terminal for a good seal to the front of the enclosure.
8. Continue to the section entitled Electrical Connections.

Electrical Connections

After opening the harsh environment LYNX terminal or installing the panel mount version, you can make the electrical connections as described on the following pages.



WARNING

BEFORE CONNECTING OR DISCONNECTING ANY INTERNAL ELECTRONIC COMPONENTS OR INTERCONNECTING WIRING BETWEEN ELECTRONIC EQUIPMENT, ALWAYS REMOVE POWER AND WAIT AT LEAST THIRTY (30) SECONDS BEFORE ANY CONNECTIONS OR DISCONNECTIONS ARE MADE. FAILURE TO OBSERVE THESE PRECAUTIONS COULD RESULT IN DAMAGE TO OR DESTRUCTION OF THE EQUIPMENT, OR BODILY HARM.

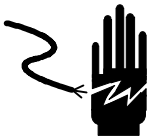
Power Requirements

The LYNX terminal is available with two power supply versions: one operates from 85 to 132 VAC; the other from 180 to 264 VAC. Both operate with a line frequency of 49 to 63 Hz. Power consumption is 12 Watts maximum. Power is applied though a modular power plug line cord (panel mount) or permanently attached line cord (harsh environment).

The integrity of the power ground for equipment is important for safety and for the dependable operation of the LYNX terminal and its associated scale base. A poor ground can result in an unsafe condition if an electrical short develops. A good ground connection also helps to minimize the influence of extraneous noise. It is important that this equipment does not share power lines with noise generating equipment such as heavy load switching, motor starter circuits, RF terminal heaters, and inductive loads.

To confirm ground integrity, a commercial branch circuit analyzer such as an ICE model SureTest ST-ID (or equivalent) is recommended. This instrument uses a high amperage pulse to check ground resistance. It measures the voltage from the neutral wire to the ground connection and will assess line loading.

Do not apply power until completing ALL external connections to the Lynx terminal.



WARNING

ONLY PERMIT QUALIFIED PERSONNEL TO SERVICE THIS EQUIPMENT. EXERCISE CARE WHEN MAKING CHECKS, TESTS AND ADJUSTMENTS THAT MUST BE MADE WITH POWER ON. FAILING TO OBSERVE THESE PRECAUTIONS CAN RESULT IN BODILY HARM.

Connect the Load Cell

Make the appropriate load cell connection to the Controller PCB for analog load cells or DigiTOL load cells.

WARNING

BEFORE CONNECTING OR DISCONNECTING ANY INTERNAL ELECTRONIC COMPONENTS OR INTERCONNECTING WIRING BETWEEN ELECTRONIC EQUIPMENT, ALWAYS REMOVE POWER AND WAIT AT LEAST THIRTY (30) SECONDS BEFORE ANY CONNECTIONS OR DISCONNECTIONS ARE MADE. FAILURE TO OBSERVE THESE PRECAUTIONS COULD RESULT IN DAMAGE TO OR DESTRUCTION OF THE EQUIPMENT, OR BODILY HARM.

CAUTION

DO NOT ATTACH AN ANALOG LOAD CELL TO THE DIGITOL SCALE INPUT ON THE CONTROLLER PCB COM3. DO NOT ATTACH A DIGITOL SCALE TO THE ANALOG LOAD CELL INPUT ON THE CONTROLLER PCB. DOING SO MAY RESULT IN DAMAGE TO THE LOAD CELL OR PCB.

Analog Load Cell Connections

The maximum cable length for analog load cell connections to the LYNX terminal depends on the total scale resistance (TSR) of the scale base. To calculate TSR:

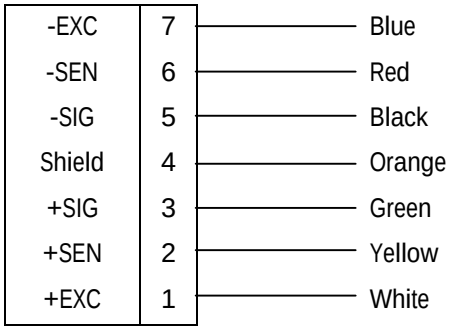
$$TSR = \frac{\text{Load Cell Input Resistance (Ohms)}}{\text{Number of Load Cells}}$$

The chart below gives recommended cable lengths based on TSR and cable gauge. The LYNX terminal can power up to eight 350 Ohm analog load cells.

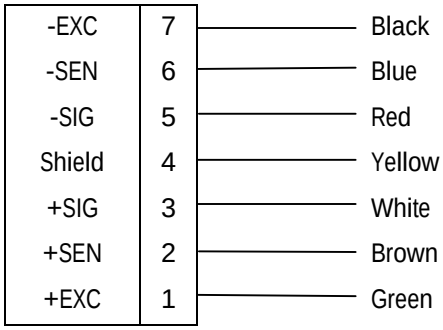
Recommended Maximum Cable Length			
TSR (Ohms)	24 Gauge (feet/meters)	20 Gauge (feet/meters)	16 Gauge (feet/meters)
350	800/240	2000/600	4000/1200
87	200/60	600/180	1000/300
44	100/30	300/90	500/150

The following diagrams describe analog load cell terminal strip wiring for standard 6-wire cable, Masstron 6-wire cable, and standard 4-wire cable.

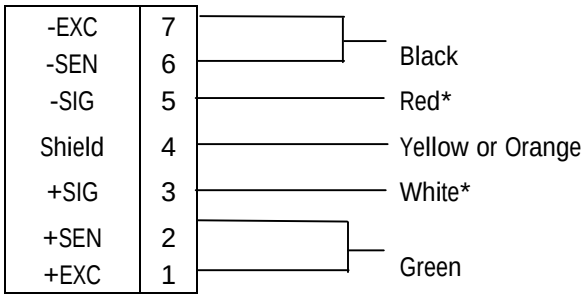
Standard 6-wire Cable J1



Masstron 6-wire Cable



4-wire Cable

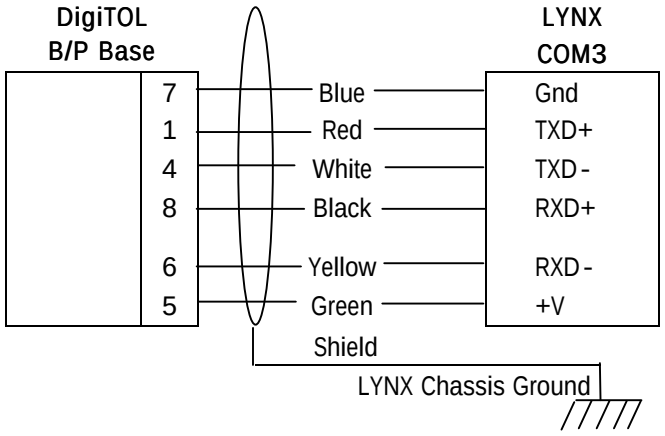


*If an increase in load results in a decrease in weight display, reverse the signal wires (+SIG and –SIG).

DigiTOL Load Cell Connections

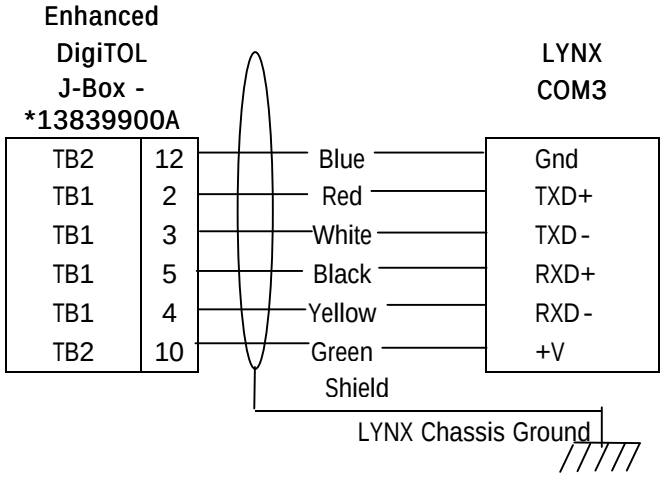
The maximum recommended cable length for all DigiTOL bases is 50 feet (15 m). The following diagram describes DigiTOL load cell terminal strip wiring.

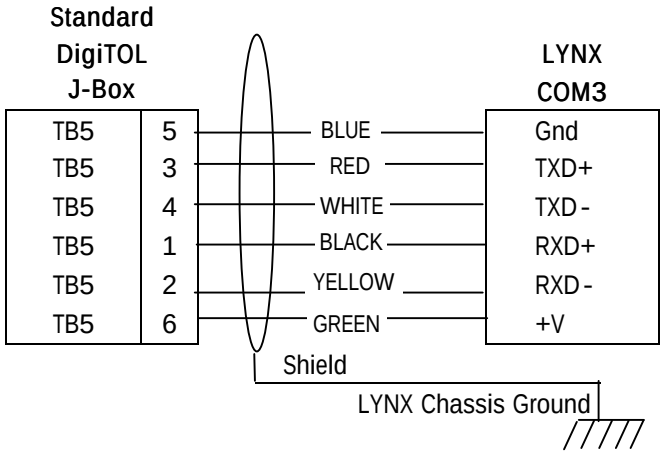
A ferrite ring must be added when connecting a DigiTOL base. Refer to Figure 2-3.



DigiTOL J-Box Connections

The maximum recommended cable length for all DigiTOL J-Box scales is 300 feet (90 m). The following diagrams describe DigiTOL J-Box terminal strip wiring.





When installing a DigiTOL base or J-Box, the included ferrite ring (P/N 126357 00A) must be installed to help attenuate noise entering the terminal through the load cell cable. The ferrite ring should be installed inside the harsh enclosure and as close to the connector on the panel mount as possible. Wrap the load cell cable conductors (including the shield ground wire) around the ferrite ring four times. Keep the ferrite ring as close as possible to the point where the cable enters the enclosure.

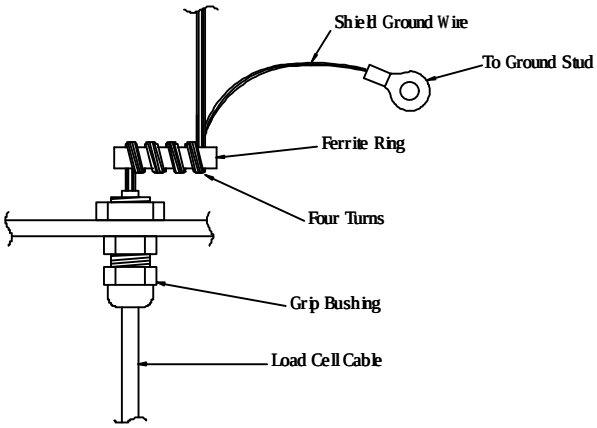


Figure 1-7 Ferrite Ring Apparatus

Serial Port Connections

Refer to the following diagrams for proper cable connections to the LYNX terminal's serial ports COM1, COM2, and COM3. All COM ports are located on the Controller board. The COM port terminal strips will accommodate wire sizes ranging from 28 to 16 AWG (0.14 to 1.5 mm^2). The terminal strips may be removed to facilitate wiring. Removal of the terminal strips also permits easier viewing of the terminal designations printed on the board back plate of the panel mount model. A label describing the I/O port locations and the pin designations for the harsh environment unit is affixed inside at the bottom of the rear enclosure.

The functionality and communication parameters for each COM port are configured in setup.

- The COM1 serial port can be RS-2332 or RS-485. Both are available simultaneously for transmitting; however, only one can receive data.
- The COM2 serial port can be RS-232 or 20mA current loop active transmit. Both are available simultaneously for transmitting; however only one can receive data.
- The COM3 serial port can be a standard RS-422 serial port or a communications port to Mettler Toledo's DigiTOL scales. Only one function can be selected.

COM1 RS-232

The maximum recommended cable length for RS232 is 50 feet (15 m).

LYNX COM1 J9

1	TXD	RS-232 Transmit
2	RXD	RS-232 Receive
3	GND	Signal Ground
4	TXDA

TXDB	--	--

*Each of these devices uses this connection.

Pinout shown is for use **without Plug In Adapter (P/N 128019 00A).

***The 8855 using RS-232 must have the 129618 00A Interface PCB. The baud rate for the LYNX must be set to 300. If the interface PCB is part number 123654 00A or 137651 00A, the LYNX TXDA terminal must be connected to Pin 2 of the 8855 Interface PCB. In this case, set the baud rate to 1200.

COM1 RS-485

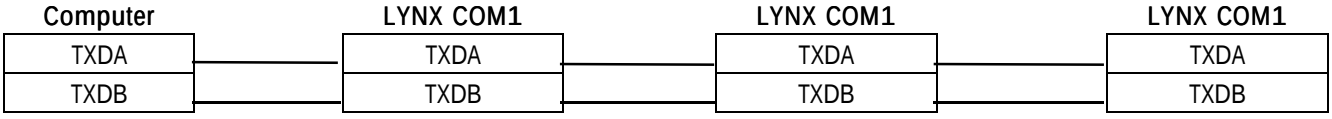
RS-485 is typically used for connecting multiple LYNX units in a network (multi-dropping.) The maximum recommended total distance for RS-485 is 2000 feet (60 m).

LYNX COM1 J9		
1	TXD	
2	RXD	
3	GND	
4	TXDA	RS-485 Transmit +
5	TXDB	RS-485 Transmit –

Either the 8142 or 8530 Host Mode must be used for multi-dropping applications.

COM1 Multi-drop Wiring

This serial port consists of RS-485 signal levels for two-wire multi-drop applications. Up to nine LYNX terminals can be connected into a single multi-drop network.



COM2 RS-232

LYNX terminal's COM2 serial port can be either RS-232 or 20 mA current loop active transmit. Both transmitters are available simultaneously; only one receiver can be used.

The maximum recommended cable length for RS-232 is 50 feet (15 m).

** The 8856 requires the optional 20 mA to RS-232 Adapter (P/N 900936 00A) for 20 mA loop applications.

COM3 RS-422

The LYNX terminal's COM3 serial port consists of RS-422 signal levels for four wire multi-drop or point-to-point applications. This port is also used to support a DigiTOL scale or DigiTOL J-Box serial interface. When interfaced to a DigiTOL base or DigiTOL J-Box, I/O capabilities are not available. The maximum recommended cable length for RS-422 interfacing is 2000 feet (600 m).

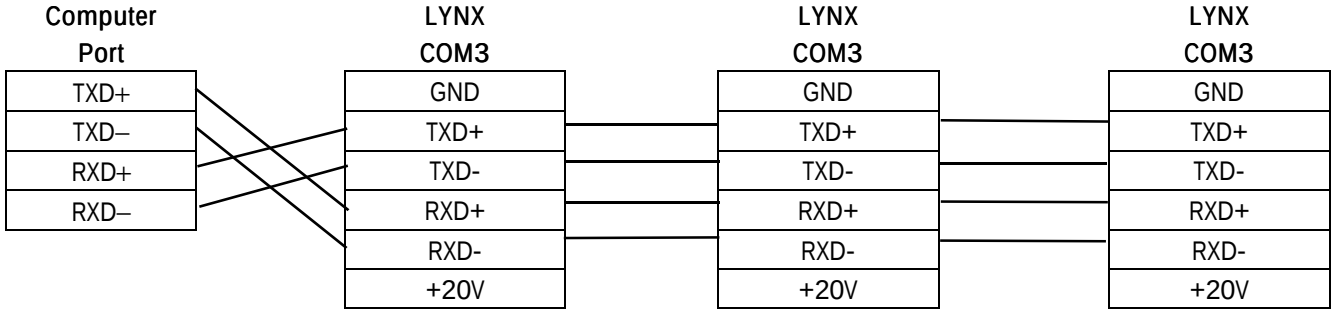
COM3 Multi-drop Wiring

Either the 8142 or 8530 Host Mode (which allows unit addressing) must be used for multi-dropping applications.

This serial port consists of RS-422 signal levels for four-wire multi-drop applications. This port will not support a DigiTOL base when using the multi-drop feature. Maximum distance for multi-drop wiring is 2000 feet (600 m). Up to nine Lynx terminals can be connected into a single multi-drop network.



Discrete Wiring

For added flexibility, the function of each input is assigned in setup mode. Any input may be assigned any available function.

The advance prompt mode input selection permits a discrete input to force an advance to the next item in a prompt list.

Refer to Appendix 3 for a complete explanation of the use of discrete inputs and outputs.

The OK to Feed input must be held at logic ground during the entire Feed cycle.

The OK to Discharge must be held at logic ground during the entire Discharge cycle.

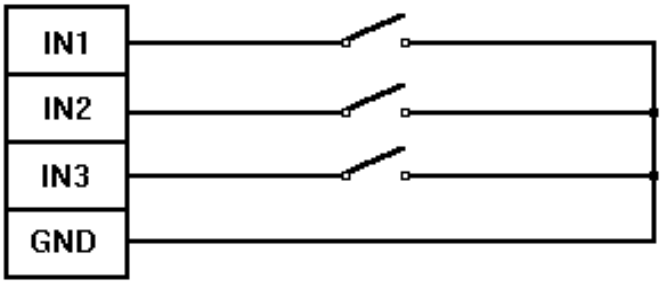
The Controller PCB contains three discrete input and five discrete output connections. The inputs are located at PAR1 and the outputs are located at PAR2. Each discrete output can sink up to 35 mA maximum.

PAR 1 Discrete Input Connections

The input connections can be selected in setup as Clear, Tare, Print, Unit Selection, Blanking, Zero, Dynamic, Inhibit Keypad, x10 Weight, Accumulator Total, OK to Feed, OK to Discharge, or Advance Prompt Mode. These connections must be referenced to ground. A switch or relay contact may be used to make this connection. The remote device should hold the input at logic ground for at least 100 ms for all functions except blanking. OK to Feed and OK to Discharge Scale functions are performed when the input is held to ground (leading edge triggered). To blank the display, the selected input must be constantly held to ground. To enable the display again, release the connection to ground.

The maximum recommended cable length between the remote device and the LYNX terminal is 10 feet.

PAR1 Terminals



PAR 2 Discrete Output Connections

The output connections can be selected in setup as setpoints (single or two-speed with tolerances), Feed, Discharge, Gross/Net Mode, Center of Zero, Scale Motion, Over-capacity or Under Zero conditions. These outputs are negative true and “ON” when the selected condition exists. The panel enclosure has an internal high level output option available to convert these signals to switch high level AC voltages.

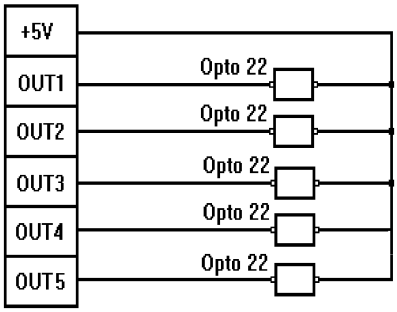
The setpoints may be selected to operate from the gross weight, net weight or displayed weight. If net weight is selected, the outputs will be “OFF” until a tare has been taken then they will react as a standard setpoint.

The setpoints operate on the absolute value of the setpoint value so they can be used for both weigh-in and weigh-out processes. They can be referenced to the 5 or 8 volt DC supply (maximum 115 mA) available on the PAR2 connector or can sink up to 35 mA of current up to 30 volt DC supply voltage from an external source.

Refer to the Interconnection Diagram at the end of Chapter 4 Discrete Connections to a Lynx filling controller.

The maximum recommended cable length between the remote device and the LYNX terminal is 10 feet.

PAR2 Terminals



Analog Output Option Wiring

The optional LYNX Analog Output provides output ranges of 4 to 20 mA, 0 to 5 VDC, or 0 to 10 VDC, plus a discrete alarm output. This output uses a 16 bit D/A converter for a very precise output. The alarm output is an optically isolated, open collector type with a 30 volt maximum limit. The Analog option can be factory or field installed in the harsh environment, filling, and panel mount enclosures. The field installation kit (0917-0225) includes detailed instructions on installation of the kit. The following diagram illustrates the Analog Output wiring:

Analog Output J1

6	+5V	Power Supply
5	Alarm	Alarm Output
4	0-10V	0-10V Analog Output
3	0-5V	0-5V Analog Output
2	GND	Signal Ground
1	4-20mA	4-20mA Analog Output

The recommended wiring for the analog output is 2 conductor, 20 GA available from Mettler Toledo After Market Parts as part number 510220190 (equivalent to Belden #8762). The following table shows the recommended load resistance for the input device and the recommended maximum cable length:

Output	Input Device Resistance	Maximum Cable Length
0-5 VDC	100kΩ Minimum	50 Feet (15 M)
0-10 VDC	100kΩ Minimum	50 Feet (15 M)
4-20 mA	500Ω Maximum	1000 Feet (300 M)

BCD Output Option Wiring

The optional LYNX BCD Output Option for panel mount options provides six decades of TTL compatible BCD data for use by other devices. Also included are inputs for hold data, demand update, and inhibit motion detection. Additional status outputs include motion, net mode, over capacity, and under zero. Connection is via a 50 pin connector on the rear panel. This option may be factory- or field-installed in the LYNX panel mount enclosure only. The field installation kit (0917-022) includes detailed instructions. The BCD output of the LYNX terminal is compatible with the BCD outputs available in earlier generations of Mettler Toledo terminals such as the 8130, 8132 and 8142. The BCD cable should be the shortest possible length, routed away from higher level wiring and should not exceed ten feet (3 m) to avoid erroneous operation due to noise. The following table illustrates the BCD connector J-1 pin designations:

PIN	SIGNAL	PIN	SIGNAL
1	10,000's	26	+5VDC, isolated, 100mA Maximum
2	40,000's	27	Gate 100,000's
3	80,000's	28	200,000's
4	Gate 10,000's	29	100,000's
5	20,000's	30	Chassis Ground
6	1,000's	31	400,000's
7	4,000's	32	800,000's
8	8,000's	33	Motion Status Output (HI = motion)
9	Gate 1,000's	34	Net Status Output (HI = net)
10	2,000's	35	no connection
11	100's	36	no connection
12	400's	37	Blank Input (HI = Blank)
13	800's	38	no connection
14	Gate 100's	39	Demand Input (LO = demand)
15	200's	40	Sync Output (LO = Data Invalid)
16	Gate 10's	41	Ground
17	10's	42	Ground
18	40's	43	Over Status Output (HI = over)
19	80's	44	Under Status Output (HI = under)
20	20's	45	no connection
21	Gate 1's	46	no connection
22	1's	47	no connection
23	4's	48	no connection
24	8's	49	Hold Input (LO = hold)
25	2's	50	Motion Detect Inhibit Input*(LO = Inhibit)

* W1 installed between pins 1 and 2 on the BCD board = Motion Detect Inhibit controlled by Pin 50. W1 installed between pins 2 and 3 = Motion Detect always inhibited.

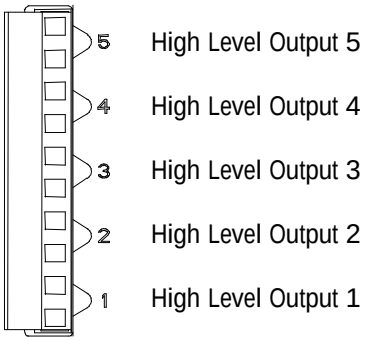
LYNX High Level Setpoint Output Wiring

The optional LYNX High Level Setpoint Outputs for the panel mount model provide high level AC interfacing (28 to 280 VAC, 1 AMP) for the standard low level discrete outputs. Up to five output modules can be factory or field installed in the output board in the Panel Mount enclosure only. AC connections are made via a ten-position terminal strip on the back panel. Other types of output modules (DC) are available from Mettler Toledo for installation in the Output Board to control DC voltages rather than AC voltage. This option is always installed in the harsh environment filling enclosure version.

There are three available field installation kits, model number 0917-0229 with one Output Module, 0917-237 with three Output Modules or 0917-0238 with five Output Modules. These kits include detailed instructions on installation of the kit.

The following diagram illustrates the High Level Setpoint Output wiring. Use the two cable ties (P/N 095915 00A) supplied to secure and provide strain relief for the wires.

Refer to Appendix 3 for a complete explanation of the use of discrete inputs and outputs.



Connect the Power Cable

A power cord is provided with the harsh environment LYNX terminal. Connection to the panel mount LYNX terminal must be made at installation. The AC power cord connection must be plugged in for panel mount models:

Be sure to confirm that the data tag on the Lynx terminal indicates the appropriate voltage prior to applying power.

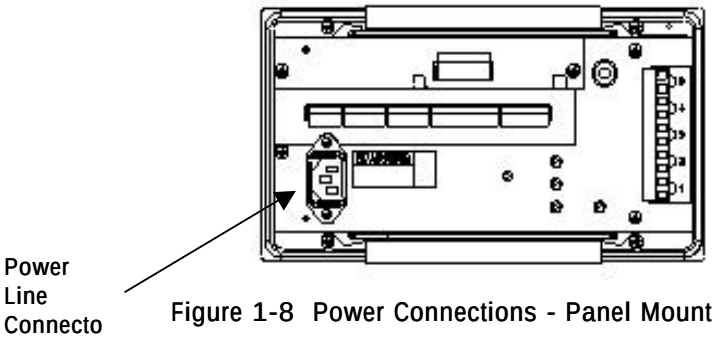


Figure 1-8 Power Connections - Panel Mount Model

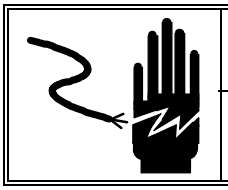

WARNING

DO NOT APPLY AC POWER TO THE LYNX AT THIS TIME.

LYNX Jumper and Switch Settings

Jumper and switch settings for the Controller PCB are described in this section.

Controller

Jumpers and switches on the Controller PCB should be set as follows:

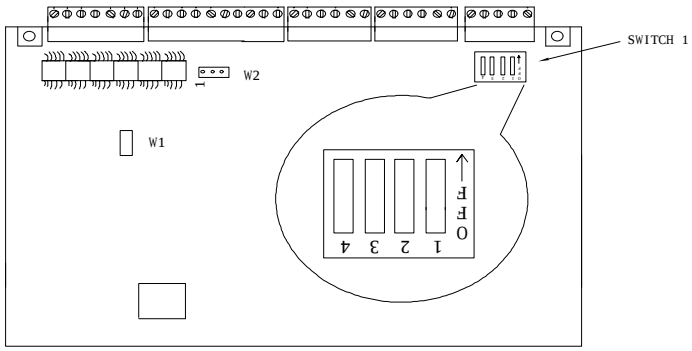

Figure 1-9 Controller PCB

Throughout this manual jumper status is denoted as follows: ON = jumper in OFF = jumper out.

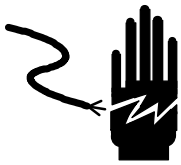
- **W1** jumper should be removed for 3 mV/V, installed for 2 mV/V analog load cell inputs.
- **W2** jumper is the voltage selection for the discrete output port PAR2. If jumpered between pins 1 and 2, the supplied voltage is 5 volts. If jumpered between pins 2 and 3 the reference voltage is 8 volts on early PCBs, 12 volts on later PCBs.
- **W3** jumper controls the on-board watchdog timer. It must be installed (enabled) except during testing at the factory.
- **W4-W7** (not shown) bypass the protective resistors installed in the LYNX terminal to protect the Controller PCB against mis-wiring to COM3. These jumpers should be installed only if communications problems occur when installing an RS-422/RS-232 converter to COM3. Leave the jumpers removed for all DigiTOL SCALES and other applications.
- **W8** (Not shown) provides a choice of +19V or 12V power for DigiTOL load cell operation. This jumper must be in the +19V (pins 1 and 2) position if analog load cells are connected.

Please note the direction of the OFF selection for Switch 1 settings. These are shown in the blown up section of figure 2-6 toward the edge of the PCB.

- **SW1-1** is the setup enable switch. This switch should be ON to access all setup parameters.
- **SW1-2** is the legal-for-trade switch. SW1-2 should be ON for legal-for-trade applications. If ON, the LYNX terminal requires setting SW1-1 OFF when exiting setup.
- **SW1-3** is the flash enable switch. SW1-3 must be ON when downloading new software. It must be OFF during normal operation.
- **SW1-4** is always OFF.

Apply Power

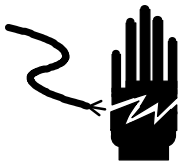
Following the connection of all external wiring AND configuration of circuit board jumpers and switches, power can be applied to the LYNX terminal. Visually inspect the unit to verify that these steps have been properly carried out, then apply power.



⚠ WARNING

VERIFY POWER, NEUTRAL, AND GROUND WIRES ARE CORRECT AT THEIR SOURCE PRIOR TO APPLYING AC POWER. FAILURE TO DO SO MAY RESULT IN BODILY INJURY.

On harsh environment models, power is applied by plugging the line cord into a **properly grounded** AC power outlet. On panel mount models, power is applied by inserting the molded end of the power cable to the rear of the unit then plugging into a properly grounded AC power outlet.



⚠ WARNING

AC POWER SOURCES MUST HAVE PROPER SHORT CIRCUIT AND OVER CURRENT PROTECTION IN ACCORDANCE WITH LOCAL AND NATIONAL ELECTRICAL REGULATIONS. FAILURE TO PROVIDE THIS MAY RESULT IN BODILY INJURY.

Power-up Sequence

The LYNX terminal goes through a series of self tests when it is turned on. These tests confirm normal terminal operation. The power-up sequence is as follows:

1. All segments of the display windows are lit. This verifies operation of all segments. The display then alternately illuminates blocks of segments.
2. The display reads “Mettler” then “Toledo” then “LYNX” while the terminal performs internal diagnostic self tests on memory and identifies optional boards that are installed. The terminal also checks the location of setup parameters and memory fields. If these have been moved or changed (as when loading software), an error message appears.
3. Next, the terminal tests communication with the load cell. If the LYNX terminal is unable to establish communication, an error is displayed.
4. After a delay, the terminal displays the software part number and advances to normal operation mode. If the Power-up Timer is enabled (refer to Chapter 3), the LYNX terminal counts down the designated period before advancing to normal operation mode.

The total power-up sequence requires approximately 30 seconds. The power-up sequence is analogous to the time required to “boot” a personal computer.

See Appendix 4 for more information on loading software and power-up error messages and actions. Software part number is shown on the display during power-up. The revision level is indicated by a letter before the part number. For example: PN A145828 indicates revision level A.

Scale Build Determination

If a standard, recommended scale build is desired, you can proceed to **Chapter 3, Programming and Calibration.**

If a nonstandard build is desired or if the analog scale input is used with a mechanical lever system conversion, the minimum increment size for the scale base must be determined before calibration. The following sections describe minimum increment size for Bench and Portable Single DigiTOL load cell scale bases and analog load cell scales.

Minimum Increment Size for Bench and Portable Single DLC Scale Bases

The table below lists the minimum increment sizes possible for the DigiTOL Bench and Portable single DLC scale base models (listed by factory number). Find the base you are connecting to the LYNX and compare the desired increment size to the minimum increment size listed.

The minimum increment size selections listed below are not legal-for-trade. Scales used in legal-for-trade applications MUST NOT BE SMALLER than the minimum increment size (e-min) listed on the scale base's data plate.

Single DigiTOL Load Cell, Minimum Increment Size			
Base Factory Number	Load Cell Capacity	Minimum Increment Size	
		lb	kg
1996-0001 1997-0001	30 kg	0.0005	0.0005
1996-0002	60 kg	0.001	0.0005
1997-0002 2096-0003 2097-0001	100 kg	0.002	0.001
1996-0003 2096-0001	140 kg	0.005	0.002
2096-0002 2096-0004 2097-0002	300 kg	0.01	0.005
2196-0001 2196-0003 2197-0001	500 kg	0.01	0.005
2196-0002 2196-0004 2197-0002	1000 kg	0.02	0.01

Minimum Increment Size for Analog Scale Input

The minimum increment size selection for an analog scale input is determined by calculating the microvolts per increment for the desired build.

To calculate the microvolts per increment:

For hazardous area applications, excitation voltage is 5.

1. Solve the following equation for μV per increment.

$$\mu V \text{ per Increment} = \frac{\text{Increment Size} \times \text{cell output} \times \text{excitation voltage (15)} \times 1000}{\text{Load Cell Capacity} \times \text{Number of Cells or Lever Ratio}}$$

   The increment size, scale capacity, and load cell capacity must all be measured in the same weight units, lb or kg. If the weight units for any of these variables are listed in kg units, multiply by 2.2046 to convert to lb units for the purposes of this calculation.

   Load cell output is rated in mV/V (millivolts per volt of excitation), marked on load cell data tag. Mettler Toledo load cells are typically 2 mV/V. Other load cells can range from 1 mV/V to 4.5 mV/V.

   The load cell capacity is the rated capacity marked on load cell data tag. The ratio is the total number of load cells in the system or the total lever ratio (if scale is a mechanical lever system conversion).

2. Calculate the total number of increments by dividing the calibrated capacity by the increment size.

$$\#\text{ Increments} = \frac{\text{Calibrated Capacity}}{\text{Increment Size}}$$

3. Use the following microvolt build table to determine if the μV per increment calculated in step 1 is within the range allowed for the total number of increments calculated in step 2. These parameters have demonstrated stable builds but smaller minimum μV per increment and larger total number of increments are possible.

Microvolt Build Table			
Total Number of Increments	Minimum µV per Increment	Maximum mV per Increment	
		2 mV/V	3 mV/V
600	5.0	43.3	63.3
1,000	3.0	26.0	38.0
1,200	2.5	21.7	31.7
1,500	2.0	17.3	25.3
2,000	1.5	13.0	19.0
2,500	1.2	10.4	15.2
3,000	1.0	8.7	12.7
4,000	0.75	6.5	9.5
5,000	0.6	5.2	7.6
6,000	0.5	4.4	6.4
8,000	0.375	3.3	4.8
10,000	0.3	2.6	3.8
12,000	0.25	2.2	3.2
15,000	0.2	1.7	2.5
16,000	0.18	1.6	2.4
20,000	0.15	1.3	1.9
25,000	0.12	1.0	1.5
30,000	0.1	0.87	1.3
32,000	0.1	0.81	1.2
35,000	0.1	0.74	1.1
40,000	0.1	0.65	0.95
45,000	0.1	0.58	0.84
48,000	0.1	0.54	0.80
50,000	0.1	0.52	0.76

The LYNX terminal should never be programmed for less than 0.5 µV per increment when used with single load cell applications and never less than 0.1 µV per increment when used with multiple load cell applications.

The LYNX terminal **CANNOT** be calibrated for builds that exceed the maximum µV per increment listed in the microvolt build table.

Sample Calculation Analog Cells

1. Refer to the following example of µV per increment calculation for a Model 2158 floor scale installation.

Scale Capacity	5000 lb
Increment Size	0.5 lb
Load Cell Capacity	2500 lb
Number of Cells	4
Cell Output	2 mV/V
Excitation Voltage	15 VDC

2. Use the formula from step 1 to calculate the µV per increment.

$$\mu V \text{ per Increment} = \frac{0.5 \text{ lb} \times 2 \text{ mV/V} \times 15 \times 1000}{2500 \text{ lb} \times 4 \text{ load cells}} = 1.5 \ \mu V/\text{inc.}$$

3. Divide the scale capacity by the increment size to determine the total number of increments.

$$\frac{5000 \text{ lb}}{0.5 \text{ lb}} = 10{,}000 \text{ Total Increments}$$

4. Check the microvolt build table to see that 1.5 µV per increment build is within the acceptable range for 10,000 increments. It is, so this is an acceptable build.

Sealing the Enclosure Weights and Measures Applications

After setup is complete, most legal-for-trade applications require sealing the enclosure so modifications can not be made. If your LYNX terminal is not used for legal-for-trade applications, skip this section. Make sure the SW1-1 switch (setup access) is OFF before sealing the enclosure.

Sealing the Panel Mount Enclosure

The enclosure may be sealed by applying destructable paper seals or a lead seal. To seal the panel mount enclosure with a lead seal:

1. Screw the special through-hole sealing screw provided into the holes shown.
2. Tighten these two screws and run a wire seal through the holes in the heads of the screws.
3. Apply the lead seal.

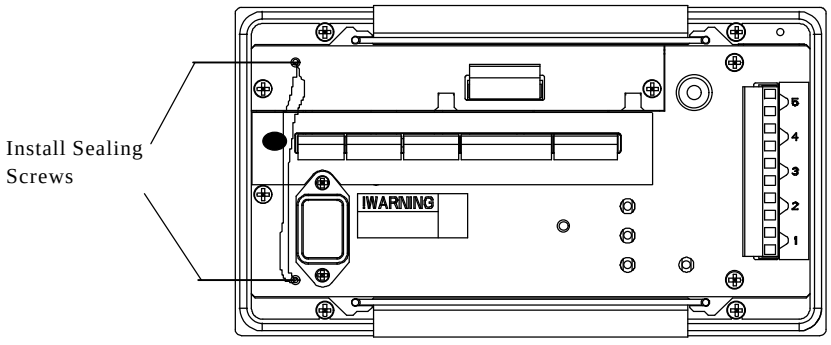


Figure 1-10

Sealing the Harsh Environment Enclosure

The harsh environment filling controller enclosure provides a similar provision for Weights and Measures sealing.

The enclosure may be sealed by applying destructable paper seals or a lead seal. To seal the harsh environment enclosure using a lead seal:

1. Locate the hole in the tang of the cover latching clip.
2. Run a wire seal through the hole and around the lead seal.
3. Apply the lead seal.

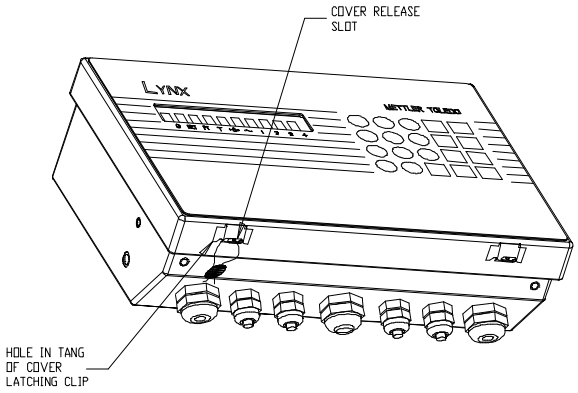

Figure 1-11

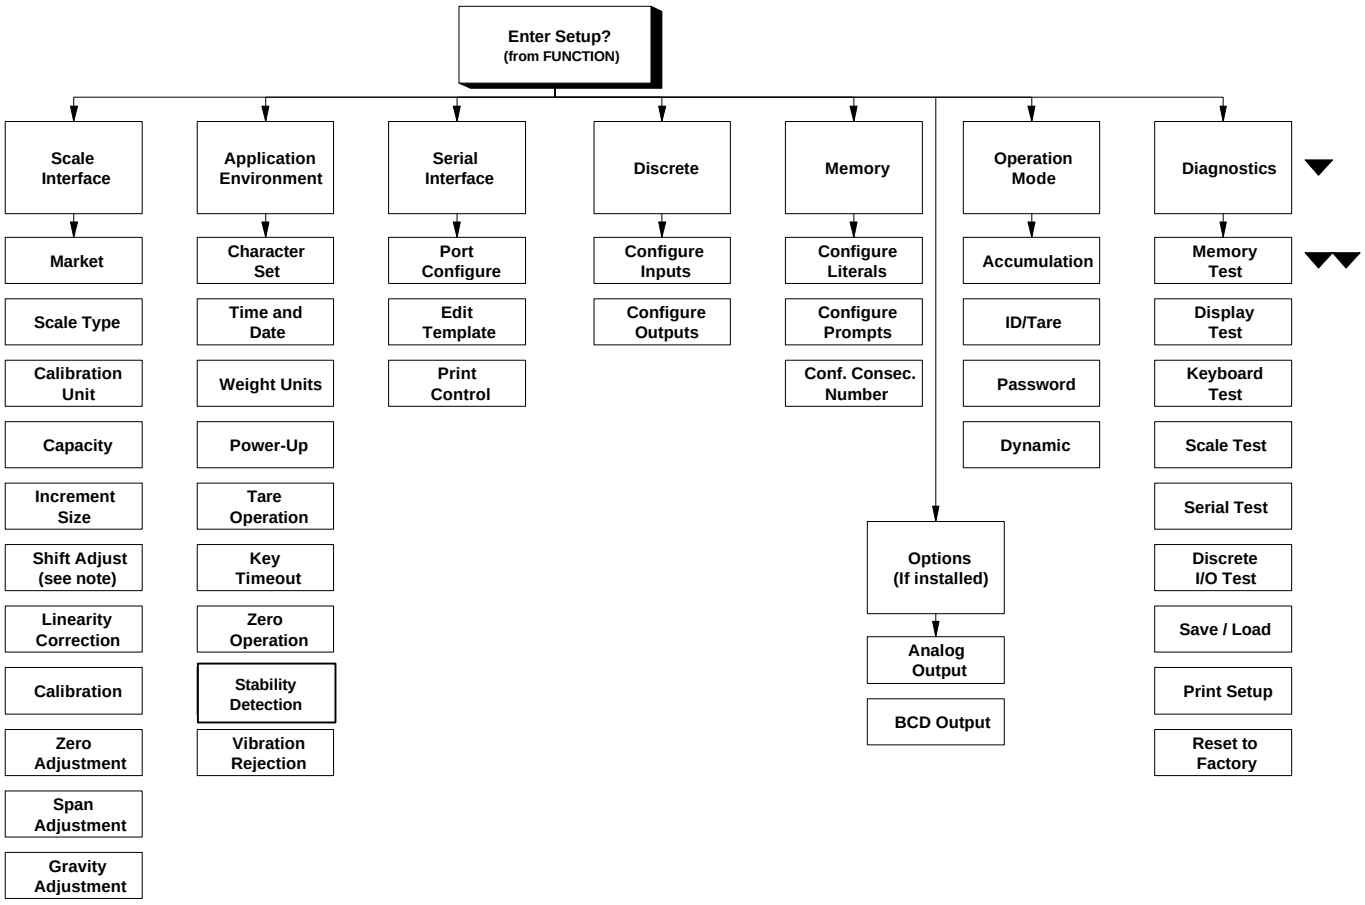
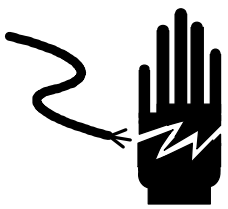
2 Programming and Calibration

This chapter discusses how to configure each program block.



Note: Shift Adjust appears only when a DigiTOL junction box is selected.



WARNING

ONLY PERMIT QUALIFIED PERSONNEL TO SERVICE THIS EQUIPMENT. EXERCISE CARE WHEN MAKING CHECKS, TESTS AND ADJUSTMENTS THAT MUST BE MADE WITH POWER ON. FAILING TO OBSERVE THESE PRECAUTIONS CAN RESULT IN BODILY HARM.

General Program Block Information

This section provides general information on keystroke functions, navigation procedures, reset to factory procedures, and program block access.

Keystroke Functions

Throughout the manual we make a distinction between key names and commands. Key names such as **ENTER** are presented in all capital letters and bold type. Commands such as "select" are presented in lowercase letters and in regular type. For example:

"Press **SELECT** ..." — means to press the **SELECT** key on the key pad.

"Select an option..." — means to use the **SELECT** key to display an item, then press **ENTER** to use that item.

The following keys are commonly used when configuring the program blocks.

Numeric keys are used to input numeric entries such as threshold values and scale capacity. These keys are also used for alpha-numeric entries.

Please refer to the section in Chapter 4 titled *Alphabetical and Special Character Entry* for more information on entering alpha-numeric data and editing data strings.

The **SELECT** key scrolls forward through a list of choices. As the **SELECT** key is pressed, programming items are listed and appear in the display area. The **SELECT** key can also be assigned a specific function such as to toggle between net and gross weight. See the Application Environment Program Block for details.

The **ENTER** key completes a response. Press **ENTER** after you have used the numeric keys to input data or used the **SELECT** key to display an option.

The **ESCAPE** key exits the current location. The parameters you have configured prior to pressing escape are saved when you exit. Each time you press **ESCAPE** you exit back to the previous level of setup. You may have to press **ESCAPE** several times to return to a desired location.

The **CLEAR** key clears the previous current entry and allows you to re-key the response.

The **ZERO** key allows you to back up in the current program block and return to the previous step if you are in the first two levels of setup. The **ZERO** key scrolls backward through a list of choices.

The **FUNCTION** key moves the cursor one character to the right allowing you to change one character in a text string such as a literal without clearing and reentering the string.

MEMORY moves the cursor one character to the left allowing you to change one character in a text string such as a literal without clearing and reentering the string.

Navigating Within a Program Block

Navigation within program blocks is the same from block to block. The following information helps you find, select, and configure the areas you need.

1. Press **SELECT** or **ZERO** to scroll through the available program blocks. When the desired block is displayed, press **ENTER** to open it.
2. Proceed through each step in all program blocks to configure all parameters the first time the LYNX terminal is programmed.

Program blocks contain sub-blocks that handle specific areas of functionality. The **SELECT** and **ENTER** keys toggle and confirm parameter option selection.

After you have configured one sub-block, the terminal automatically proceeds to the next. When you finish the last sub-block in a program block, the terminal proceeds to the next program block.

You can exit your position within a program block by pressing **ESCAPE** at any time. You may need to press **ESCAPE** several times to exit setup mode and continue to normal operation.

Cursors under the display indicate your position within a program block. The following chart describes the cursors relative to block position.

Arrows		Block Position
1 Arrow	▼	Indicates you are in Setup Mode top level
2 Arrows	▼▼	Indicate you are in a Program Block
3 Arrows	▼▼▼	Indicate you are in a sub-block
4 Arrows	▼▼▼▼	Indicate you are configuring an element within a sub-block

Reset to Factory

The Diagnostics and Maintenance block has a Master Reset option that lets you reset **all parameters in all blocks** including or excluding Scale Interface. Reset to Factory is discussed in detail in the section entitled Diagnostics and Maintenance Program Block at the end of this chapter.

Reset to Factory returns **all setup parameters** to their original settings. You cannot reset a single value or specify only a few of the sub-block values.

Appendix 7 lists the default values for all program block parameters.

To reset the program block parameters:

1. From within the Diagnostics and Maintenance program block, press **ENTER** at the **Factory Reset** prompt.
2. Respond to the **Sure?** prompt. Select **Y** or **N** to continue with the reset operation, then press **ENTER**. The terminal responds with the prompt **Rst Cal? N**

3. Press SELECT to display Y or N to include or exclude calibration parameters in the reset. The LYNX terminal displays the message Resetting while the parameters are reset to factory values.

   The LYNX terminal then goes through its power-up sequence and returns to normal operating mode.

Use caution when resetting the values for Calibration. All calibration values will be reset.

Program Block Access

Before you can set program block parameters, you must enter the setup mode. To access the program blocks:

1. Press the FUNCTION key.
2. Press SELECT until the prompt Setup? is displayed, then press ENTER.
3. If the Setup? prompt is not displayed and the terminal returns to Normal Operation mode, try the following steps:
   - Remove AC power
   - Turn SW1-1 (on the Controller PCB) to the ON position
   - Power the terminal and repeat steps 1 and 2.

The first program block, Scale Interface (Scale I/F), should be displayed. Press ENTER to open this block or press SELECT to choose another block to open.

Exit Setup Mode

When you have finished configuring the parameters in each sub-block and wish to return to normal operation, press ESCAPE several times until the prompt Exit? is displayed, then press ENTER to confirm. If you do not wish to exit at this time, press SELECT to choose another program block within the setup mode.

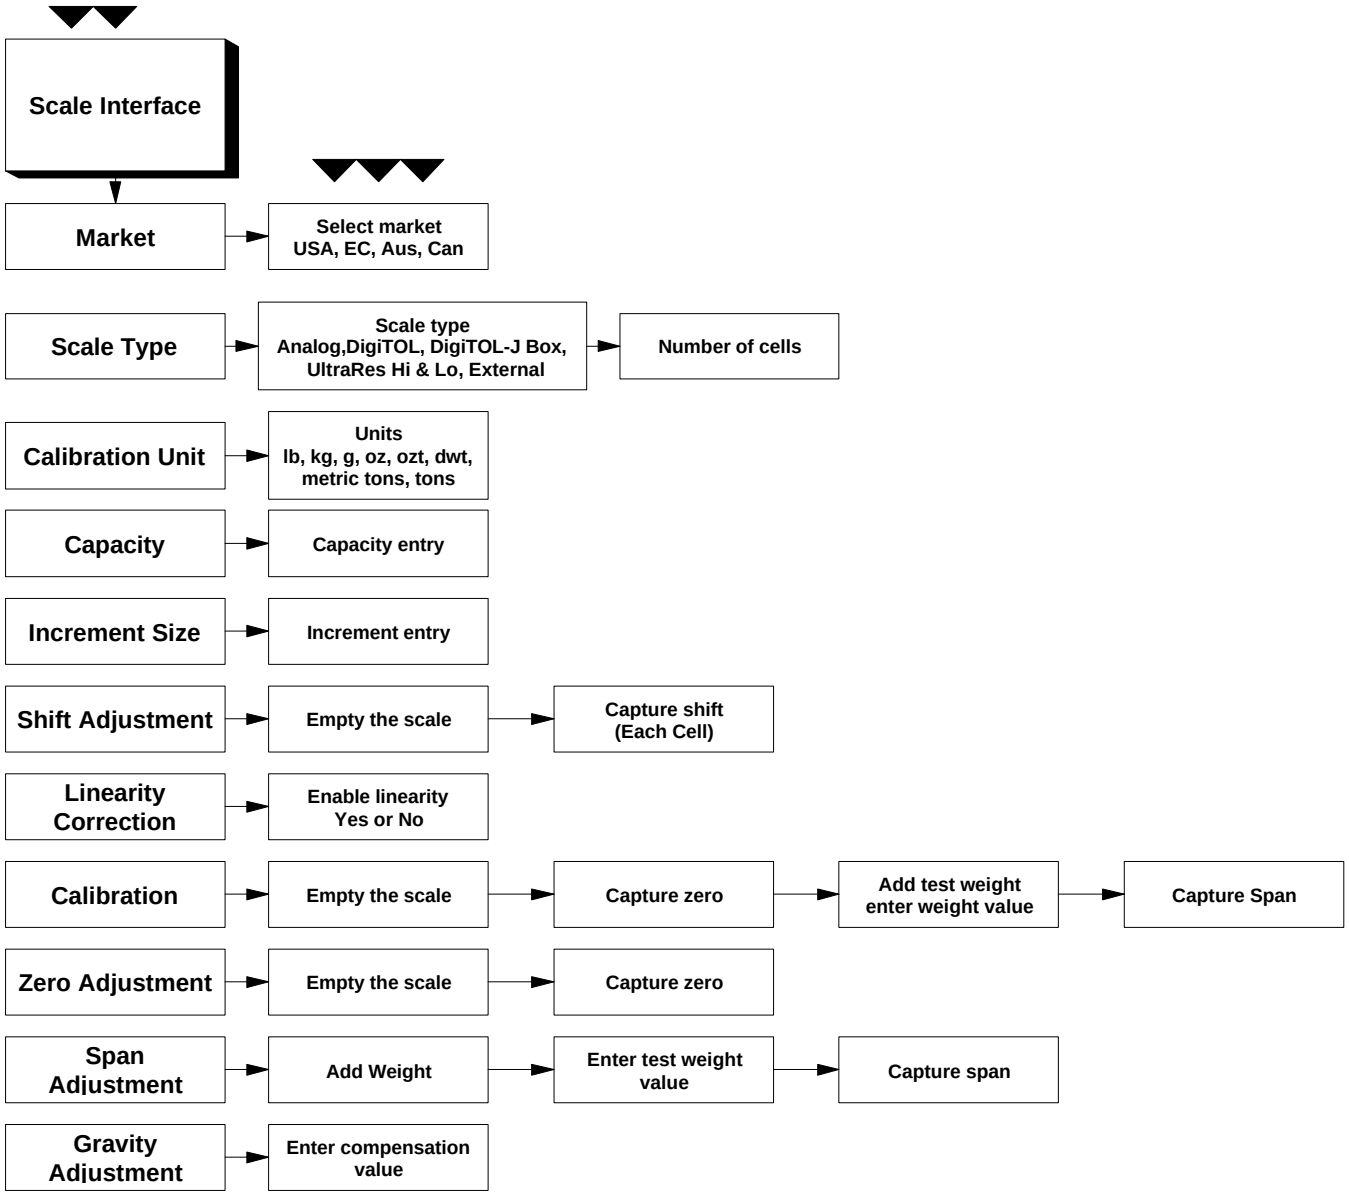
When you exit setup mode, the LYNX terminal may go through the power-up sequence before returning to normal operating mode depending on the changes you made.

If you wish to protect the setup parameters from being inadvertently changed by an operator, you can turn SW1-1 to the OFF position.

If the legal-for-trade switch (SW1-2) is ON, the LYNX terminal prompts SW1-1 ON? when exiting setup. This is a reminder to turn SW1-1 OFF for legal-for-trade applications.

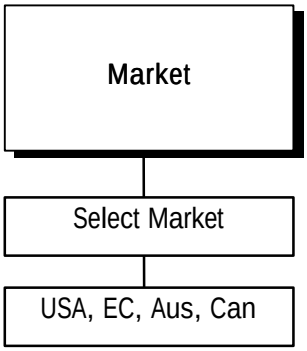
Scale Interface Program Block

The Scale Interface program block (Scale I/F) lets you set and calibrate the features that affect weighing performance. The following diagram describes this block:



Press **ENTER** at the **Scale I/F** prompt to access the Scale Interface program block and configure the sub-blocks.

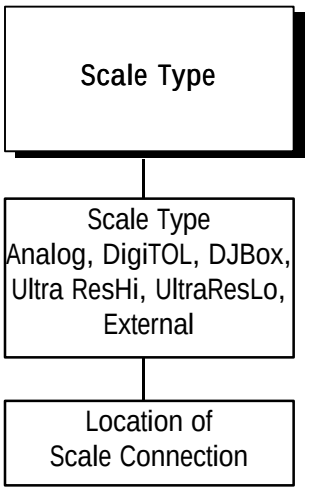
1. Market Sub-block



The Market sub-block lets you select a country or market area and limit parameters that affect legal-for-trade programming options.

1. Press **ENTER** at the **Market** prompt to access this sub-block.
2. Press **SELECT** until the desired market area is displayed, then press **ENTER**. Market areas include:
   - USA — United States
   - EC — European Community
   - Aus — Australia
   - Can — Canada
3. The LYNX terminal automatically continues to the next sub-block, or you can press **ESCAPE** twice to exit the setup mode.

2. Scale Type Sub-block



External scale type is used when the LYNX terminal will act as a remote keypad/display for another LYNX terminal or Mettler-Toledo terminal, such as Jaguar, that is capable of handling Toledo Continuous Output and Command Input formats.

The Scale Type sub-block prompts you for the type of scale that will be used.

1. Press **ENTER** at the **Scale Type** prompt to open the sub-block.
2. Press **SELECT** until the desired scale type is displayed, then press **ENTER**. Scale types include
   - Analog
   - DigiTOL (bench or portable – xx96, xx97*)
   - DJBox (Enhanced DigiTOL J-Box)
   - UltraResHi (UB, UBs, xx97**)
   - UltraResLo (UB, UBs, xx97**)
   - External (Using LYNX terminal as a remote display)

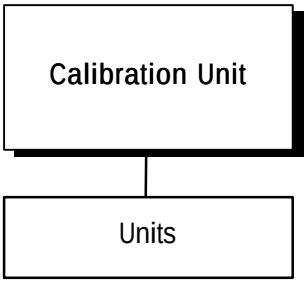
   *Produced prior to 5/98.
   **Produced after 4/98.

   If DigiTOL J-Box is Selected
   At the **Cells?** prompt, press **SELECT** to choose the correct number of cells connected to the DigiTOL J-Box (2-4). Press **ENTER** when the displayed number is correct.

   If External is Selected
   At the **Port?** prompt, press **SELECT** to indicate the COM port where the external scale is connected.

   If the scale type is changed, the LYNX terminal displays the message **PleaseWait** as it exits setup mode and goes through the power-up sequence. You must reenter setup mode to continue configuring the program blocks.
3. Continue to the next sub-block or exit the setup mode.

3. Calibration Unit Sub-block



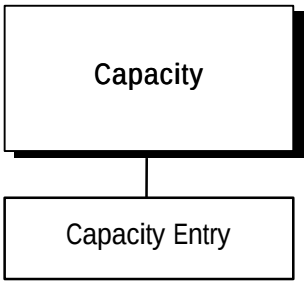
This sub-block lets you enter the units of measure to use when calibrating the scale and configuring capacity and increment size. **Recalibration is required if you change the calibration unit.**

1. Press **ENTER** at the **Calib Unit** prompt to open the sub-block.
2. At the **Unit?** prompt, press **SELECT** until the desired calibration unit is displayed, then press **ENTER**. Calibration units include

   - Pounds (lb)
   - Kilograms (kg)
   - Grams (g)
   - Ounces (oz)
   - Troy Ounces (ozt)
   - Penny Weight (dwt)
   - Metric Tons (t)
   - Avoirdupois Tons (ton)
   - Pounds/Ounces (lb/oz)

   If Pounds/Ounces (lb/oz) is selected, the capacity and increment sizes entered in sub-blocks 4 and 5 must be ounce values. For example, configuration for a 100 lb capacity scale using 0.5 ounce increments would be 1600 for capacity and 0.5 for the increment.
3. Continue to the next sub-block or press **ESCAPE** to exit the setup mode.

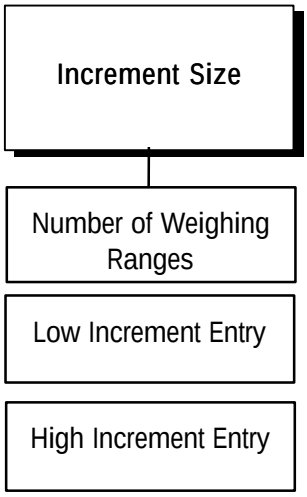
4. Capacity Sub-block



The Capacity sub-block lets you enter the maximum scale capacity. The capacity is given in the calibration units. The weight display will indicate **OVER RANGE** at 5 increments above this weight.

1. Press **ENTER** at the **Capacity** prompt to open the sub-block. The LYNX terminal displays the current scale capacity.
2. Key the desired scale capacity using the numeric keys.
3. Press **ENTER** to set the capacity.
4. Continue to the next sub-block or exit the setup mode.

5. Increment Size Sub-block



This sub-block lets you specify the increment size for one or more weighing ranges. An increment size is the smallest change in weight value that the terminal is able to display. For example, if the increment size is specified as 0.1 then, starting at 0.0 on the scale, adding an increasing load will cause the terminal to display 0.1, 0.2, 0.3 and so on through the entire weighing range of the scale. If you selected 0.2 for the increment size, the addition of an increasing load would display 0.2, 0.4, 06 as the weight is rounded to the 0.2 increment through the entire range.

If two ranges are selected, the operation is as described above except that two increments are now used over portions of the weighing range. For example, consider a scale configured for two ranges with the low increment specified as 0.1 and the high increment as 0.2. The scale displays weight by 0.1 increments through the first range until weight reaches the “low to high” (LoHi) threshold point, then by 0.2 increments through the second range to capacity. Increments may count by 1,2, or 5.

To configure the increment size:

Press **ENTER** at the **Increment Size** prompt to open the sub-block.

At the **Ranges?** prompt, use the **SELECT** key to choose 1 or 2 ranges.

If 1 Interval Selected

At the **Low?** prompt, enter the low increment size (0.00001-100).

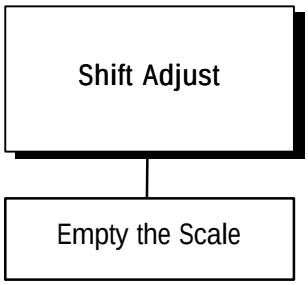
If 2 Intervals Selected

At the **Low?** prompt, enter the low increment size (0.00001-100).

At the **High?** prompt, enter the high increment size (0.00001-100). The high increment must be greater than the low increment.

At the **LoHi?** prompt, enter the weight value where the scale will switch from the low increment to the high increment.

6. Shift Adjust Sub-block



The Shift Adjust prompt appears only if you selected Power Module (DigiTOL J-Box) as the scale type. When using a DigiTOL J-Box, each cell’s output must be adjusted so that it is equal to the other cells. Cell adjustment is done by applying weight to each cell in sequence as prompted.

1. Press **ENTER** at the **Shift Adj** prompt to open the sub-block.
2. At the **EmptyScale** prompt, remove any weight on the platform, then press **ENTER**. The display reads **Cal Zero** as the terminal captures zero.

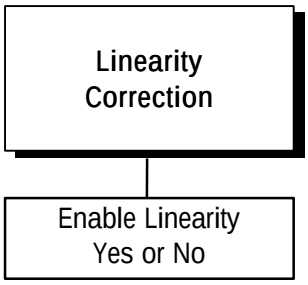
3. At the **Load On N** prompt, place on the platform a test weight equaling approximately 50% of the scale's capacity.

   The LYNX terminal automatically shift adjusts the scale for the current load cell as the display reads **Do Shift N**.

4. Repeat steps 2 and 3 for each load cell connected to the DigiTOL J-Box.

5. When all load cells are shift adjusted, the terminal indicates **Shift Done**. Continue to the next sub-block or exit the setup mode.

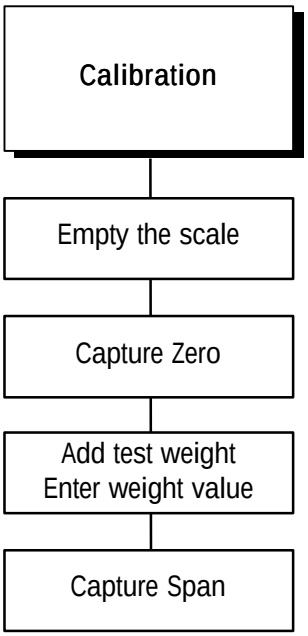
7. Linearity Correction Sub-block



Linearity correction lets you calibrate the scale using calibration reference weights at mid-scale and full-scale ranges. Linearity correction allows for compensation of the non-linear performance of a load cell(s) or weighing system. If linearity correction is enabled, the calibration process requires additional steps. The terminal must be calibrated or recalibrated **after** you enable linearity correction.

1. Press **ENTER** at the **Linearity** prompt to open the sub-block.
2. Select **Y** to enable or **N** to disable linearity correction.
3. Continue to the next sub-block or exit the setup mode.

8. Calibration Sub-block



Calibration involves emptying the scale then placing a known test weight on an empty platform and allowing the LYNX terminal to capture values for zero and span. You can calibrate a scale with or without linearity correction. The LYNX terminal prompts you through the calibration.

Without Linearity Correction

1. Press **ENTER** at the **Calibrate** prompt to open the sub-block.
2. At the **Empty Scale** prompt, remove any weight on the platform, then press **ENTER**. The terminal automatically captures zero while the display reads **Cal Zero.** The cursor moves across the display indicating the operation is in progress.
3. At the **Add Weight** prompt, place on the platform a test weight equaling the scale's capacity or another practical weight. Press **ENTER**.

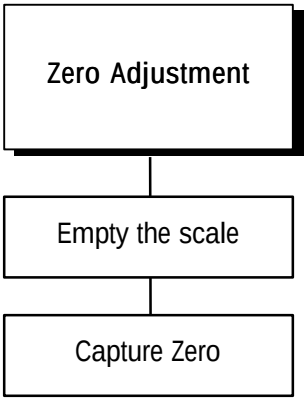
   While there is no minimum amount of test weight for calibration; Mettler Toledo recommends 60 to 100%. A calibration error may result if insufficient weight is used.

4. Enter the amount of weight you added in step 3. Press **ENTER**. The terminal automatically captures span while the display reads **Cal Span**. A cursor moves across the bottom of the display indicating the operation is in progress.
5. The terminal indicates **Cal Done**, then continues to the next sub-block.

With Linearity Correction Enabled

1. Press **ENTER** at the **Calibrate** prompt to open the sub-block.
2. At the **Empty Scale** prompt, remove any weight on the platform then press **ENTER**. The terminal automatically captures zero while the display reads **Cal Zero.** The cursor moves across the display indicating the operation is in progress.
3. At the **Add Mid Wt** prompt, place a weight on the platform equaling between 35% and 65% of the scale's capacity.
4. Enter the amount of weight you added in step 3. Press **ENTER**. The terminal automatically captures mid-scale while the display reads **Cal Mid.** The cursor moves across the display indicating the operation is in progress.
5. At the Add **Full Wt** prompt, place weight on the platform equaling at least 90% of scale capacity or as much as is practical. Press **ENTER**.
6. Enter the amount of weight you added in step 5. Press **ENTER**. The terminal automatically captures full scale while the display reads **Cal Full.** The cursor moves across the lower display indicating the operation is in progress. When finished, the terminal indicates **Cal Done**.
7. Continue to the next sub-block or exit the setup mode.

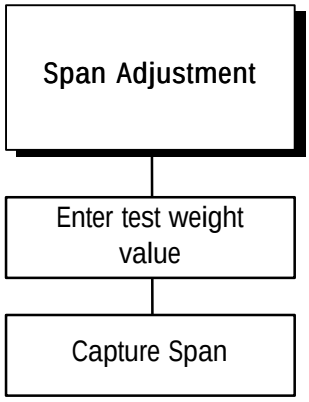
9. Zero Adjustment Sub-block



The zero value is the scale-empty reference as determined during calibration. The Zero Adjustment block lets you re-establish this value to compensate for any change since the last calibration. The scale must be empty before resetting the zero value.

1. Press **ENTER** at the **Zero Adj.** prompt to open the sub-block.
2. At the **Empty Scale** prompt, remove any weight on the platform and press **ENTER**. The terminal captures zero while the display reads **Cal Zero.** The cursor moves across the display indicating the operation is in progress. The LYNX terminal displays the message **Zero Done** when finished.
3. Continue to the next sub-block or exit the setup mode.

10. Span Adjustment Sub-block

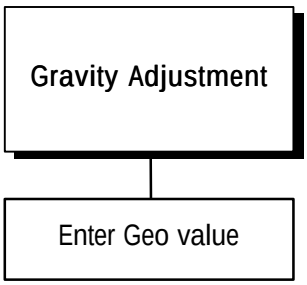


If linearity correction is enabled, you cannot do a span adjustment.

The Span Adjustment feature lets you make minor span adjustments without completely recalibrating the scale. Adjust the span by placing known test weights on the scale prior to entering span adjust. The terminal guides you through the procedure.

1. Press **ENTER** at the **Span Adj.** prompt to access the sub-block.
2. At the **Add Weight** prompt, place a test weight on the platform.
3. Enter the amount of weight placed on the platform in step 2. The display reads **Cal Span** while the terminal captures the new span. The cursor moves across the display indicating the operation is in progress. When finished, the LYNX terminal displays the message **Span Done**.
4. Continue to the next sub-block or exit the setup mode.

11. Gravity Adjustment Sub-block



This sub-block is designed to let you enter a factor to compensate for gravitational differences between the factory calibration location and where the scale is currently located.

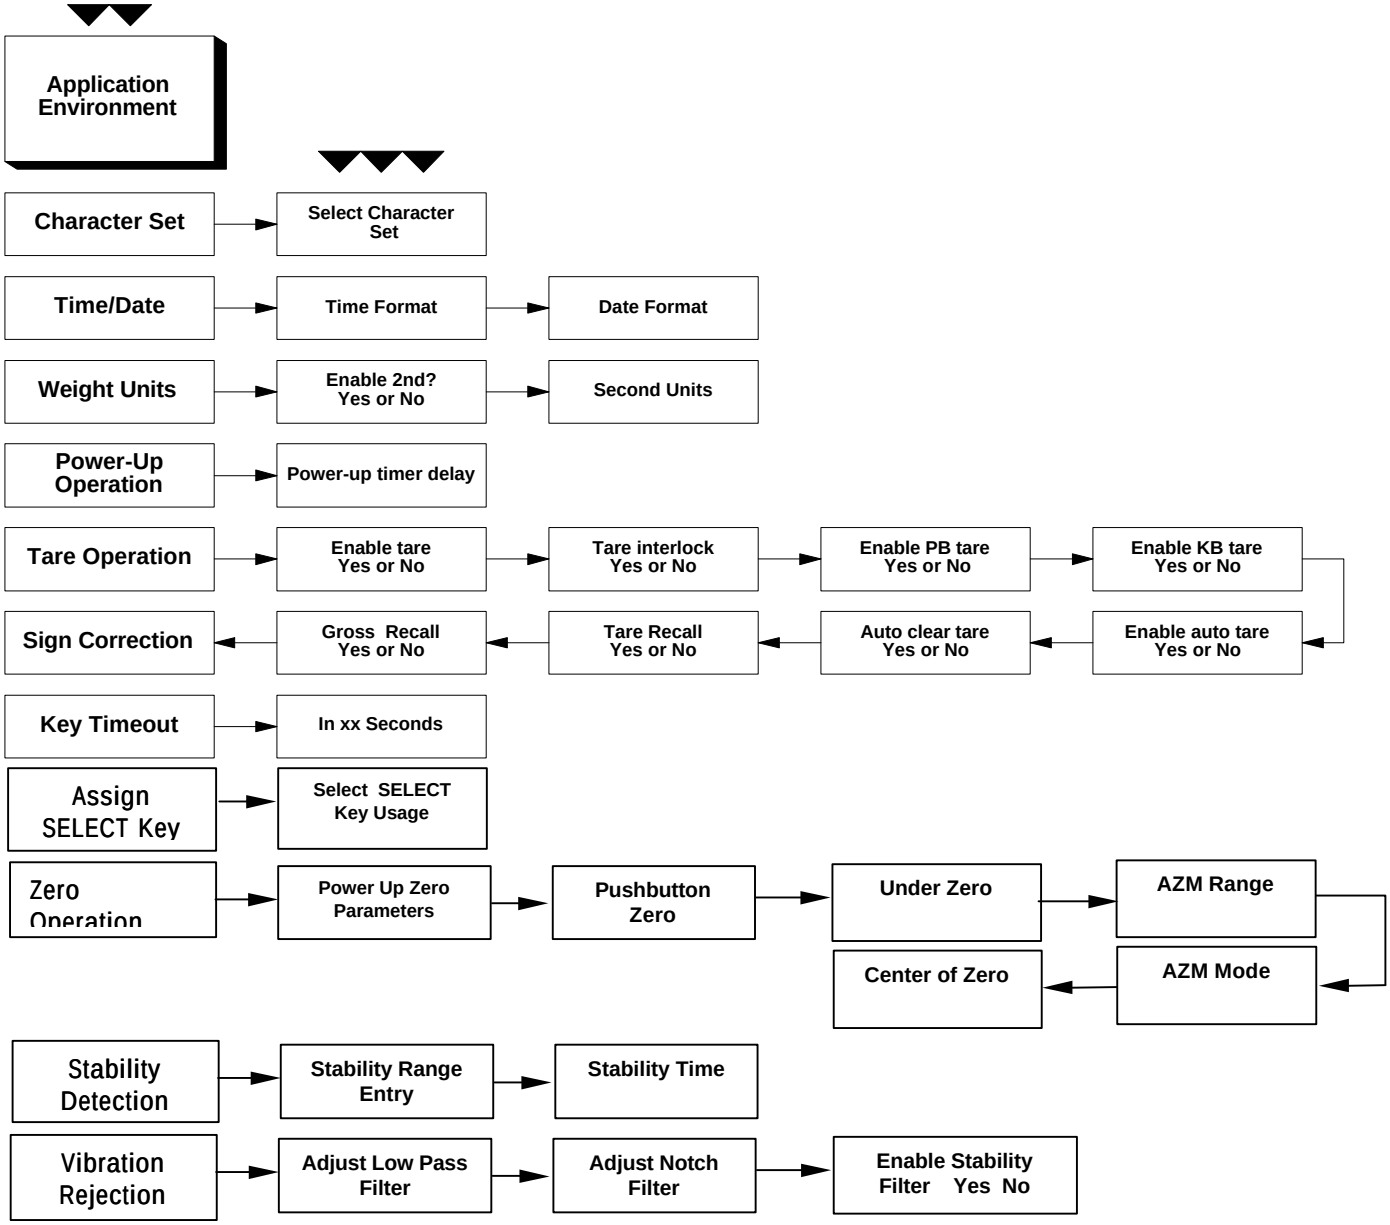
If on-site calibration has already been performed, leave this value set to the factory default.

When you access the Gravity Adjustment sub-block, the current value is displayed.

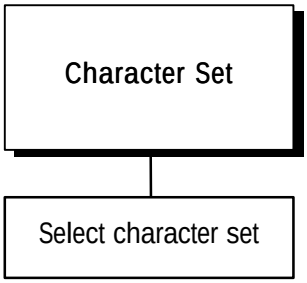
1. Press **ENTER** at the **Gravity** prompt to open the sub-block. The display reads **Geo Val?** and shows the current adjustment value.
2. Press **ENTER** to accept the current factor or enter a new gravitational factor. Use the Geo Value Table in Appendix 5 to determine the appropriate constant.
3. Return to the first sub-block if desired, or exit the setup mode.

Application Environment Program Block

The Application Environment program block (Applic Env) lets you set the features of the scale that are specific to the customer's application. The following diagram describes this block:



1. Character Set Sub-block



Set your printer to match the character set chosen in this sub-block.

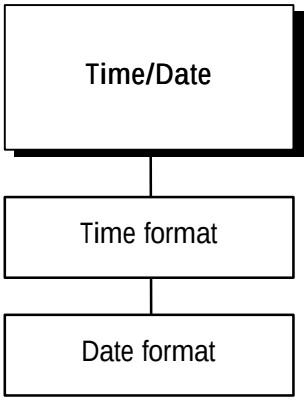
This sub-block lets you select the character set that the LYNX terminal will use for all displayed messages. Depending on the character set, some ASCII characters will be replaced automatically with specific international characters.

1. Press Enter at the **Char. Set** prompt to access the sub-block.
2. Press **SELECT** to choose the character set. Options include:

   - USA
   - France
   - Germany
   - England
   - Denmark-1
   - Sweden
   - Italy
   - Spain-1
   - Japan
   - Norway
   - Denmark-2
   - Spain-2
   - Latin America

3. Press **ENTER** to use the displayed character set. Appendix 1 lists the ASCII characters that are replaced with this selection.

2. Time and Date Sub-block



The time format choices are given with the separator you selected in step 2.

This sub-block lets you set the time and date format. If you select "None" in step 3 below, the time or date feature is disabled.

To configure the sub-block:

1. Press **ENTER** at the **Time/Date** prompt, then press **ENTER** at the **Time Fmt?** prompt.
2. At the **Separ.?** prompt, select a character to separate hour, minutes, and seconds. Choices include:

   - (:) colon
   - (-) dash
   - (.) period
   - (sp) space

3. Next, select the desired time format. Choices include:

   - 24:MM — 24 hour clock, no seconds
   - 24:MM:SS — 24 hour clock with seconds
   - 12:MM — 12 hour clock, no seconds
   - 12:MM:SS — 12 hour clock with seconds
   - None — Time disabled through **MEMORY** key

4. Press **ENTER** at the **Date Fmt?** prompt.

5. At the **Separ.?** prompt, select a character to separate month, day, and year. Choices include:

   - (:) colon
   - (-) dash
   - (.) period
   - (sp) space
   - (/) slash

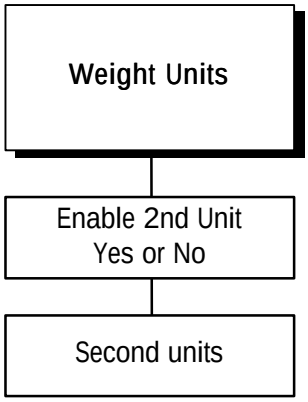
The date format choices are given with the separator you selected in step 5.

6. Next, select the desired date format. Choices include:

   - MM/DD/YY — Month (num), Day (num), Year (2 digits)
   - MMM/DD/′YY — Month (alpha), Day (num), Year (4 digits)
   - DD/MM/YY — Day (num), Month (num), Year (2 digits)
   - DD/MMM/′YY — Day (num), Month (alpha), Year (4 digits)
   - YY/MM/DD — Year (2 digits), Month (num), Day (num)
   - ′YY/MMM/DD — Year (4 digits), Month (alpha), Day (num)
   - None — Date disabled through MEMORY key

7. Press **ENTER** to continue to the next sub-block or press **ESCAPE** to exit the setup mode.

3. Weight Units Sub-block



The Weight Units sub-block lets you select a second unit of measure for weight display, and enable or disable units switching. You can select a second weight unit from various pre-programmed standard weight units, or you can create a special weight unit with a custom name and conversion factor.

To configure the sub-block:

1. Press **ENTER** at the **Wgt Units** prompt to open the sub-block.
2. At the **Ena 2nd?** prompt, select **Y** or **N** to enable or disable unit switching to second units. If unit switching is enabled, it will switch between the Main Units and the Second Units.

   Mettler Toledo recommends you disable unit switching when using setpoints to avoid errors and confusion.

The unit selected for calibration is the main unit.

3. If enabled, at the **2nd?** prompt, select a secondary weight unit. Selections include:

   - lb
   - kg
   - g
   - oz
   - lb-oz
   - ozt
   - dwt
   - t
   - ton
   - user (custom)

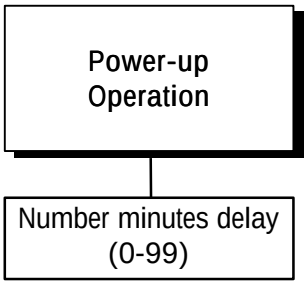
If User (Custom) Is Selected

A value up to six digits can be entered (five digits to the right of the decimal).

- At the **Fct?** prompt, enter a conversion factor. This factor is the number that will by multiplied by the main units to calculate the custom unit. Some rounding error may occur since this calculation uses a higher internal resolution to determine the converted value. Make sure that the maximum converted value does not exceed the display capacity of the display.
- At the **Name?** prompt, enter the name for the custom unit, up to three characters.

4. Continue to the next sub-block or exit the setup mode.

4. Power up Operation Sub-block



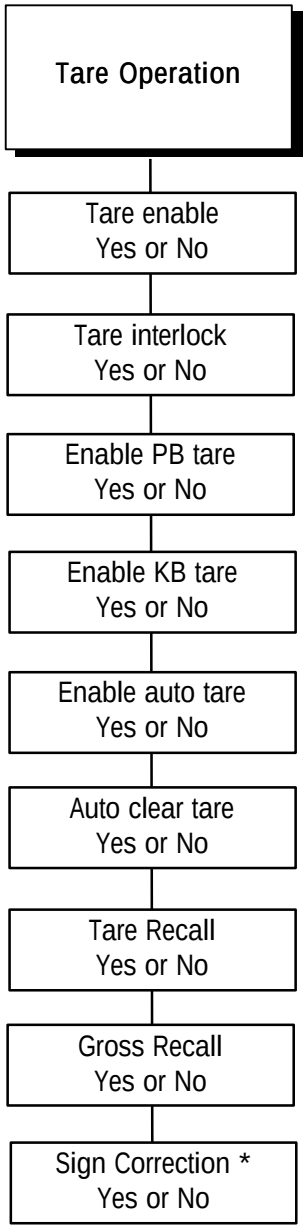
The Power-up sub-block lets you specify a time delay before the scale is operational. This delay allows a sufficient warm-up period for stabilization of the scale and load cell electronics.

The LYNX terminal displays a count-down clock indicating the time remaining in the specified warm up period.

To configure the sub-block:

1. Press **ENTER** at the **Power-Up** prompt.
2. At the **Delay?** prompt, use the numeric keys to enter the number of minutes (0-99) that the LYNX terminal will delay prior to indicating weight in normal operating mode.
3. Continue to the next sub-block or exit the setup mode.

5. Tare Operation Sub-block



* In C Revision and later software, sign correction setup prompts are located here. In earlier revisions refer to Serial Port Configure sub-block.

The tare value is stored in the LYNX terminal's memory. In case of power loss, the terminal will display a correct net value when power is

The Tare Operation sub-block lets you enable or disable the various tare options the LYNX terminal offers. You can enable or disable any combination of tare options depending on your needs. Three types of tare are available:

- **Pushbutton Tare** — If enabled, pushbutton tare subtracts the weight of an empty container on the scale when the TARE key is pressed. The LYNX terminal displays the net weight when material is placed in the container.
- **Keyboard Tare** — If keyboard tare is enabled, you can enter the known tare weight of a filled container, then press the **ENTER** key to subtract the container tare weight from the gross weight and display the net weight of the sample. This is also called preset tare.
- **Auto Tare** — If auto tare is enabled, the terminal automatically tares the scale when the load on the platform exceeds a predetermined threshold value and settles to no-motion.

You can also configure:

- **Auto Clear Tare** — If auto clear tare is enabled, tare is automatically cleared and the indicator returns to gross mode when the weight goes above, then drops below a predetermined threshold value. You can also specify that tare be automatically cleared after a print operation.
- **Tare Interlock** — If tare interlock is enabled, limits are placed on how tare values can be cleared and entered in legal-for-trade applications.

To configure the Tare Operation sub-block:

1. Press **ENTER** at the **Tare Oper.** prompt to open the sub-block.
2. At the **Tare Ena?** prompt, select **Y** or **N** to enable or disable tare. If you select **N** to disable tare, the terminal proceeds to the Zero Operation sub-block. Access to other tare features is not possible if the tare feature is disabled.

At the **Tr Intlk?** prompt, select **Y** or **N** to enable or disable tare interlock.

1. At the **PB Tare?** prompt, select **Y** or **N** to enable or disable pushbutton tare.
2. At the **KB Tare?** prompt, select **Y** or **N** to enable or disable keyboard tare.
3. At the **Auto Tr?** prompt, select **Y** or **N** to enable or disable auto tare.

If Auto Tare Is Enabled

- Press ENTER at the Threshold? prompt; then enter the desired threshold value. The threshold value is a unit value such as 1.5 pounds. When weight on the platform exceeds the threshold value, then settles to no-motion, the terminal automatically tares.
- Press ENTER at the Rst Thold? prompt, then enter the desired reset threshold value. This is also a unit value and must be less than the tare threshold. When weight on the platform falls below the reset threshold value, as when the load has been removed, the terminal automatically rearms the auto tare trigger.

Printing and tare operations will wait until a stable condition exists before proceeding with the action. See Stability Detect sub-block in this chapter for more information on setting the sensitivity.

- At the Chk Mot? prompt, select Y or N to enable or disable the motion check. If enabled, the terminal checks for stability of the load on the platform before resetting the auto tare trigger.

7. At the Auto Clr? prompt, select Y or N to enable or disable auto clear tare. Auto clear tare depends on the tare interlock condition.

Tare will clear only at gross zero if tare interlock and auto clear tare are both enabled.

If Tare Interlock and Auto Clear Tare Are Enabled
The terminal proceeds to the Gross Recall prompt. Continue to step 8.

If Tare Interlock Is Disabled, and Auto Clear Is Enabled

If auto clear tare after print is enabled, LYNX terminal does not display the Clear Threshold prompt.

- At the Aftr Prt? prompt, select Y to clear tare after a print command is issued, or select N to clear tare at a predetermined threshold value.

If Auto Clear Tare After Print Is Disabled

- Press ENTER at the Clr Thold prompt; then enter a unit value. When the gross scale weight exceeds then falls below the threshold value, the terminal automatically clears tare and returns to gross mode.
- At the Chk Mot? prompt, select Y or N to enable or disable the motion check. If enabled, the terminal checks for stability of the load on the platform before proceeding with auto clear tare.

8. At the T Recall? prompt, select Y or N to enable or disable the tare recall feature. If enabled, the terminal displays the tare value when you press FUNCTION in normal operating mode.

In C Revision and later software, sign correction setup prompts are located here. In earlier revisions refer to Port Configure sub-block.

9. At the G Recall? prompt, select Y or N to enable or disable the recall gross weight feature. If enabled, the terminal displays the gross value when you press the FUNCTION key in normal operating mode.

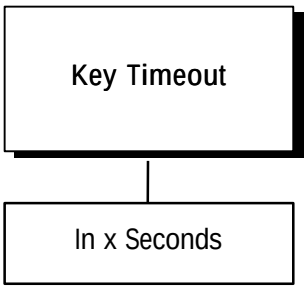
10. Press ENTER at the Sign Corr prompt to configure the net sign correction feature (see note at left).

Net Sign Correction allows you to store a gross weight in the tare register, then print the correct gross, tare, and net values when the tare weight is placed on the scale.

11. At the Sign Corr? prompt, select Y or N to enable or disable net sign correction in the demand output print. If enabled, Net Sign Correction compares the weight in the tare register with the current weight on the scale and configures them so the net weight is always positive.

12. Continue to the next sub-block or press ESCAPE to exit the setup mode.

6. Key Timeout Sub-block

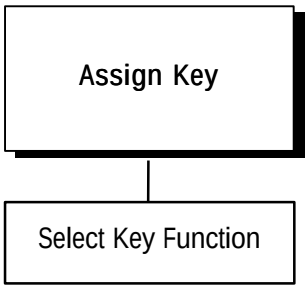


The Key Timeout sub-block lets you set the time in seconds for the operator to input tare and setpoints and for recall of non-active weight displays such as gross weights. After the time-out has elapsed, the LYNX terminal will return to its previous condition.

To configure the sub-block:

1. Press **ENTER** at the **Key Timeout** prompt to open the sub-block.
2. At the **In x Sec** prompt, enter the number of seconds for the timeout (0 - 9). A value of 0 disables the timeout.

7. Assign Select Key Sub-Block



The **SELECT** key can be reassigned to frequently repeat functions to reduce the number of keystrokes required to perform those functions.

1. Press **ENTER** at the Assign Key prompt to access the sub-block.
2. Press **SELECT** to scroll through the following assignments that are available for the **SELECT** key.

   None = Use the **SELECT** key in its default manner

   Net/Gross = Toggle between Net and Gross display

   Net/Tare = Toggle between Net and Tare display

   Net/Grs/Tr = Toggle between Net, Gross, and Tare display

   Units Sw. = Toggle between Primary and Secondary units

   Prompt = Process the Prompt List

   Store ID = Store an ID record

   Recall ID = Recall an ID record

   SP1 Entry = Prompt for entry of Setpoint number 1

   SP2 Entry = Prompt for entry of Setpoint number 2

   Dynamic Wt = Start dynamic weighing cycle

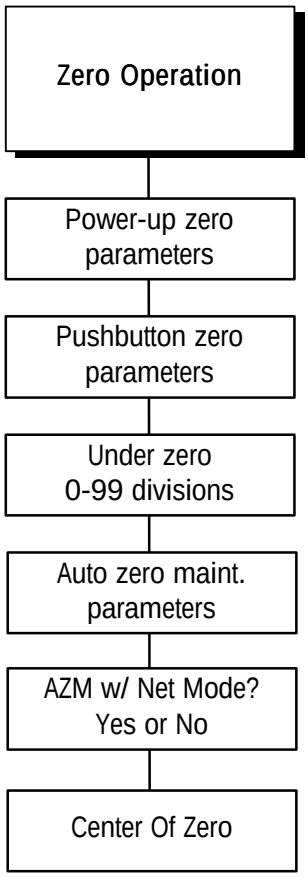
   Tot Recall = Recall Total Accumulator to Display

   Sub Recall = Recall Subtotal Accumulator to Display

   Print Accm=Print the Accumulation Report

3. Press **ENTER** to accept the reassignment selected.

8. Zero Operation Sub-block



The Zero Operation sub-block lets you set the zero reference parameters. You can configure any or all of the following options:

- **Power-up Zero** — automatically zeros the terminal at power-up if weight on the scale is within a given range. If the weight on the scale is beyond the designated range, the display will not read zero until weight falls within the range.
- **Pushbutton Zero** — manually compensates for material build-up on the scale and recaptures zero.
- **Zero Blank** — determines when the display will go blank if weight falls below gross zero.
- **Auto Zero Maintenance (AZM)** — automatically compensates for small changes in zero resulting from material build-up on the scale or temperature fluctuations.
- **AZM w/Net Mode** — automatically corrects zero close to both net zero and gross zero.
- **Center of Zero** — determines if the center-of-zero annunciator lights at gross zero only or at gross and net zero.

Power-up zero capture and pushbutton zero ranges are based on the actual calibrated zero. If the positive and/or negative range value for power-up zero is greater than that for pushbutton zero, it is possible for the scale to automatically capture more weight on power-up than can be compensated for manually.

Mettler Toledo recommends that power-up zero be disabled by setting Positive and Negative range to 0% for scales such as tanks and hoppers which may lose power in the middle of a control process.

To configure the sub-block:

1. Press **ENTER** at the **Zero Oper.** prompt to open the sub-block, then press **ENTER** at the **PwrUp Zr?** prompt to configure the power-up zero option.
2. At the **+ Range** prompt, enter a numeric value for the positive range of zero capture. You can enter a value from 0 to 10 indicating a percent of scale capacity.
3. At the **– Range** prompt, enter a numeric value for the negative range of zero capture. You can enter a value from 0 to 10 indicating a percent of scale capacity.

Pushbutton zero values are stored in the LYNX terminal's memory. In case of power loss, the terminal will display an accurate weight when power is restored.

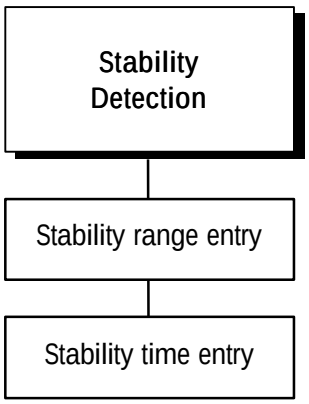
4. Press **ENTER** at the **PB Zero?** prompt to access these parameters.
5. At the **+ Range** prompt, enter a numeric value for the positive capture range. This value is a percent of scale capacity (0 - 99).
6. At the **– Range** prompt, enter a numeric value for the negative capture range. This value is also a percent of scale capacity (0 - 99).
7. At the **Under Zero** prompt, press **ENTER** to configure how far below gross zero the LYNX terminal will continue to display weight.

8. At the **Blank?** prompt, enter 0-99 to specify the number of display divisions behind gross zero before the display shows **Under Zero**. The default is 5 divisions. An entry of "99" allows the maximum negative weight display before **Under Zero** is displayed.
9. Press **ENTER** at the **AutoZrMain** prompt to access the parameters for this option.

A pre-determined number of consecutive readings from the scale must fall within the range specified before the scale compensates for changes in the zero reference.

10. At the **Rng?** prompt, enter a range (in divisions) within which the LYNX terminal adjusts for small changes in zero. Enter divisions 0.01 - 99.9. Adjustments are made at a rate of 0.03 increments per second.
11. At the **AZM Net?** prompt, select **Y** to automatically correct gross zero in both net and gross weight modes. Select **N** for AZM to function only in gross mode.
12. At the **COZ?** prompt, select if the center-of-zero annunciator should illuminate at **Gross** only, at **G&N** (Gross and Net) zero, or be **Off**.
13. Press **ENTER** to continue to the next sub-block or press **ESCAPE** to exit the setup mode.

9. Stability Detection Sub-block



The stability detection feature determines when a no-motion condition exists on the weighing platform. The sensitivity level determines what is considered stable. Printing and tare operations will wait for scale stability before carrying out the command.

Stability detection occurs over a predefined period of time and allows a predetermined "acceptable" amount of motion in scale divisions. The acceptable amount of motion is considered the range and the period of time is called the interval.

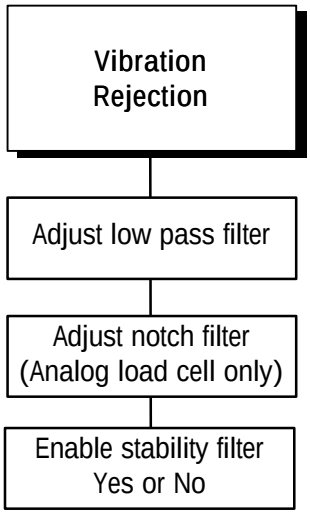
To configure the sub-block:

1. Press **ENTER** at the **Stability** prompt, then press **ENTER** at the **Stab Rng** prompt.
2. At the **Range?** prompt, enter the acceptable motion range (+/- 0.1 to 99.9 divisions).
3. Press **ENTER** at the **# Updates?** prompt to configure the period of time to check for no-motion.

To disable motion detection, set the Range to 99.9 and the Seconds to 0.1.

4. At the **In XX sec** prompt, enter the number of seconds (0.1 to 1.0) that the weight must remain within the range values for a no-motion condition.
5. Continue to the next sub-block or exit the setup mode.

10. Vibration Rejection Sub-block



If the scale type is other than analog, the prompt for step 2 does not appear. Begin configuration with step 3.

The LYNX terminal has several filters to compensate for environmental disturbances such as vibration or noise. This sub-block lets you configure the TraxDSP filters for optimum vibration/disturbance rejection.

The Vibration Rejection sub-block allows programming of values including

- **Lowpass Filter Frequency** — Low Pass Frequency is the frequency above which all disturbances are filtered out. The lower the frequency, the longer the settling time required for the scale.
- **Poles** — The number of poles determines the slope of the filtering cutoff. For most applications, a slope value of 8 (analog load cell), 4 (DigiTOL load cell) is acceptable; however, decreasing this number will improve settling time slightly. For analog load cells, do not enter a value lower than 4 for this parameter.
- **Notch Filter Frequency (Analog Load Cell Only)** — The Notch Filter allows selection of one specific frequency that can also be filtered out. This enables setting the lowpass filter higher to filter out all but one frequency (that the notch filter will handle) and obtain a faster settling time.
- **Stability Filter** — The Stability Filter eliminates weight changes within a given range around a stable weight reading. This filter eliminates fluctuations in the weight display created by movement. Do not enable the Stability Filter for dynamic weighing, batching, or filling applications. Use the stability filter only for static weighing applications.

To configure the sub-block:

1. Press **ENTER** at the **Vibration** prompt to open the sub-block.
2. At the **Autotune?** prompt, select **N** to bypass the autotune process, or select **Y** to automatically tune the lowpass and notch filters.

   If **Y**, the display reads **Adjust 1** and the cursor moves across the display while LYNX terminal measures the vibration under current conditions. The LYNX terminal then automatically displays **Measure 1** and the cursor moves across the display while the LYNX terminal adjusts the vibration filter accordingly.

   The LYNX terminal can repeat the measure and adjust process up to six times depending on the amount and regularity of the vibration. When the vibration adjustment is made, the LYNX terminal indicates either **Auto Tune Completed or Auto Tune Failed** and continues to the next prompt.
3. Press **ENTER** at the **Low-pass?** prompt to configure the parameters governing the low pass filter. Disturbances falling below these parameters pass through the filter; disturbances above the parameters are filtered out.

4. At the **Freq?** prompt, enter the frequency above which disturbances are filtered out. You can enter frequency values in the range 0.2 to 9.9.
5. At the **Poles?** prompt, enter the number of poles.

The Adjust Notch parameter appears only if you are configuring an analog load cell. If configuring a DigiTOL load cell, LYNX terminal proceeds to step 7.

6. Press **ENTER** at the **Notch?** prompt to configure the parameters governing selective filtering.
7. At the **Freq?** prompt, enter the frequency at which any disturbance is filtered out. You can enter frequency values in the range 0.0 to 99.9.
8. At the **Stable?** prompt, select **Y** or **N** to enable or disable the stability filter. Use this for static weighing applications only.
9. Continue to the next program block or exit the setup mode.

The default values for vibration rejection that are programmed in the factory are good for most applications; however, if you find that the weight display is still unstable, the following steps may help:

a. Set the Low Pass filter to 9.9, poles to 8, and the Notch Filter to 0.0.
b. Lower the frequency setting of the Low Pass Filter by increments of 1.0 and observe the amount of variation at each setting. When you see a noticeable improvement in display stability, vary the Low Pass Filter setting slightly below the frequency setting in increments of 0.1 for minimum fluctuation.
c. Record the frequency and approximate number of increments variation for the settings that show noticeable reduction in display fluctuation. This is the lowest frequency of vibration causing the display to fluctuate.
d. Set the Low Pass Filter back to 9.9.
e. Set the Notch Filter to the frequency that caused the largest reduction in increments change (recorded in step c).
f. If the display is still fluctuating too much, repeat step b. observing the display fluctuation. Reduce the Low Pass Filter setting until the display is acceptable.

Always be sure to check the weight display setting time after each filter adjustment to be sure that the setting time is fast enough for the application.

Serial Interface Program Block

The Serial Interface program block (Serial I/F) lets you set parameters controlling data flow across the LYNX terminal's serial communication (COM) ports. The input and output COM ports are used to communicate data on demand or continuously such as for printing applications. COM ports may also be used for information exchange between a PC and the terminal.

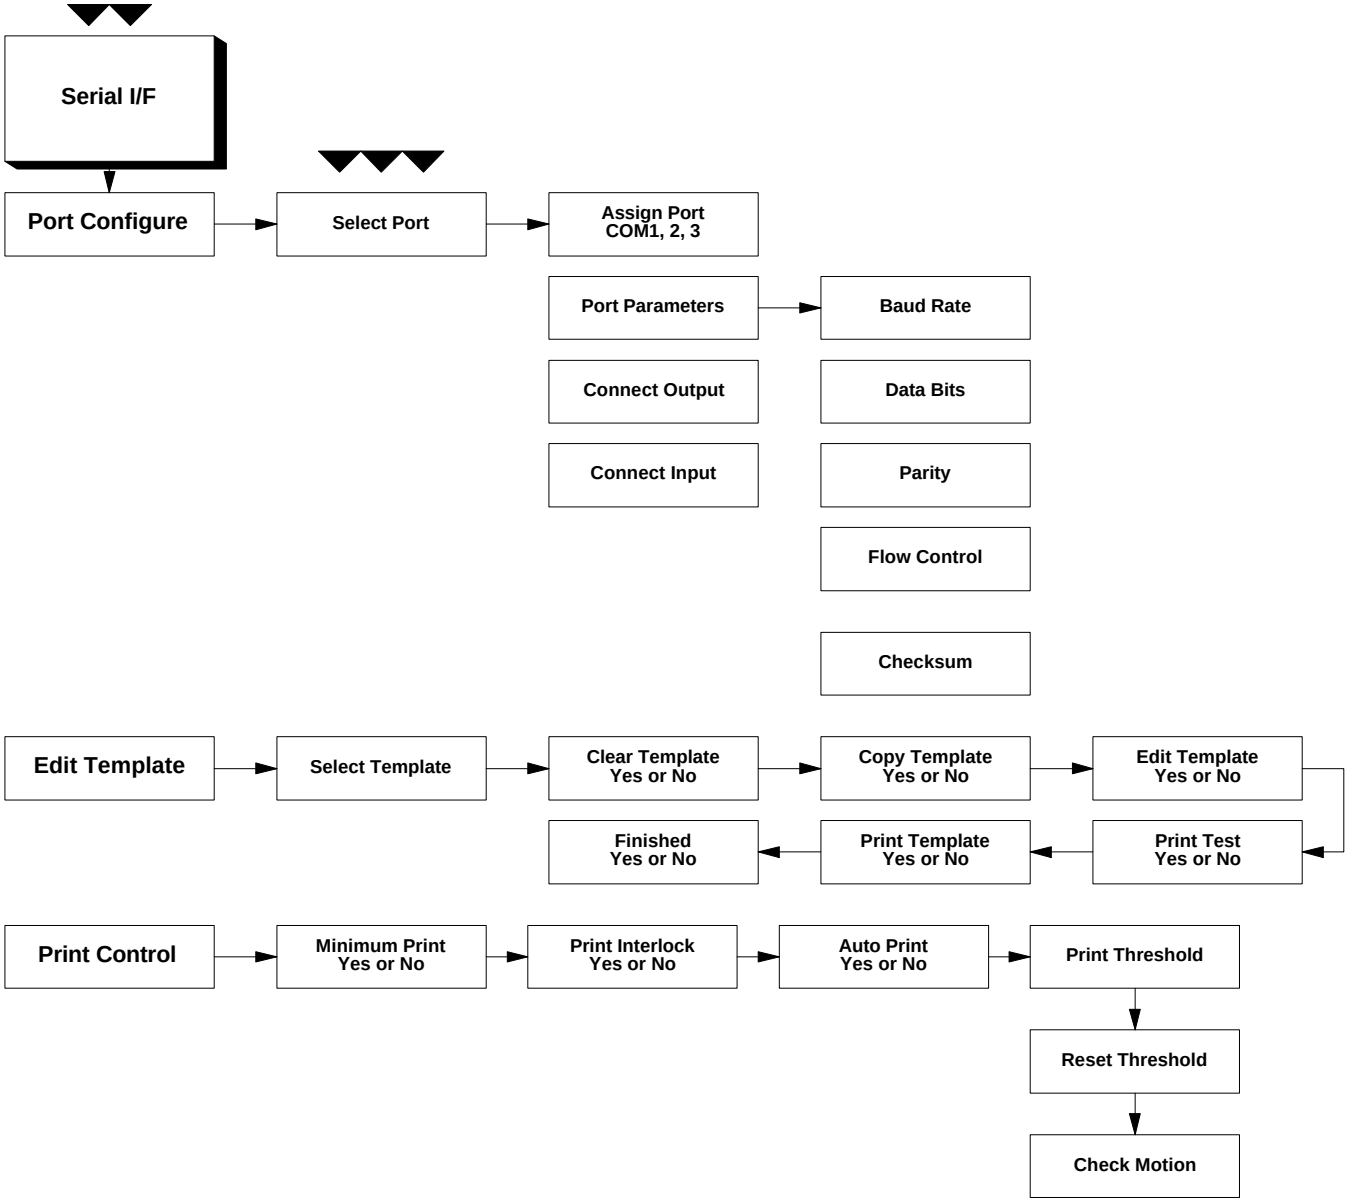
The LYNX terminal has three serial I/O ports (COM1, COM2, and COM3). While one port might be used to support a DigiTOL type scale, others can be used for data input/output as needed.

If a DigiTOL scale or DigiTOL J-Box is configured through the Scale Interface block, COM3 will be unavailable. In this case, you must reprogram the scale type in order to access COM3. If a DigiTOL scale or DigiTOL J-Box is selected, the serial port is automatically setup by the LYNX terminal for communications to a DigiTOL base.

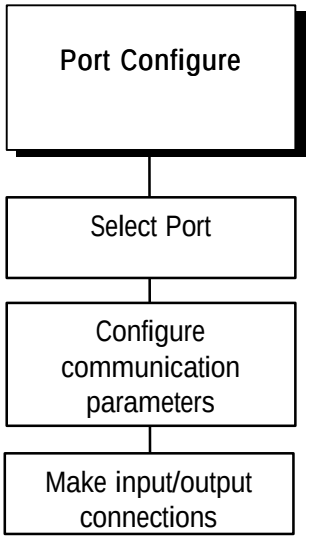
The Serial Interface program block lets you

- Assign port parameters and configure ports
- Edit demand output templates
- Program print control parameters

The following diagram describes the Serial Interface program block:



1. Port Configure Sub-block



This sub-block lets you configure the serial ports on your terminal for data exchange. You can configure only those ports that are physically available. For example, if a DigiTOL scale is connected, its COM port will not be available for configuration.

See Appendix 1 of this manual for detailed information on hardware connections, data output format, and template programming and formats.

To configure the program block:

1. Press **ENTER** at the **Serial I/F** prompt to open the program block. Press **ENTER** at the **Port Confg** prompt.
2. At the **Port?** prompt, select COM1, COM2, or COM3 as the port to be configured.
3. Press **ENTER** at the **Parameters** prompt, then configure the following parameters.
   - Baud Rate
   - Data Bits
   - Stop Bits (COM2 and COM3)
   - Parity
   - Flow Control
   - Checksum

Baud Rate

The baud rate is the rate of information transfer in bits-per-second.

- Press **ENTER** at the **Baud** prompt, then select the desired rate for the selected port. Baud rates include
  - 300
  - 600
  - 1200
  - 2400
  - 4800
  - 9600
  - 19.2k
  - 38.4k

Data Bits

Data bits refers to the number of bits that make up an ASCII character that is transferred between two units. Most Mettler Toledo equipment communicates using seven data bits.

- Press **ENTER** at the **Data Bits** prompt, then select 7 or 8 data bits.

COM1 always has 1 stop bit. If COM1 is selected, the Stop Bits prompt does not appear.

Stop Bits

The number of stop bits to be transmitted for each ASCII character can be selected for COM2 and COM3. Most Mettler Toledo products will work with either 1 or 2 stop bits.

Parity

Parity is an error checking mechanism for each byte.

- Press **ENTER** at the **Parity** prompt, then select the desired option. Parity options include

  Even — the terminal sends an even number of logic 1 data bits. If the sum is odd, an eighth logic 1 bit is added for an even total. If the sum is even, a 0 bit is included to leave it unchanged.

  Odd — the terminal sends an odd number of logic 1 data bits. If the sum is even, an eighth logic 1 bit is added for an odd total. If the sum is odd, a 0 bit is included to leave it unchanged.

The Space and Mark parity selections are not provided on COM1.

  Space — the eighth bit is always OFF (logic 0).

  Mark — the eighth bit is always ON (logic 1).

  None — for use with eight data bits.

XON/XOFF requires character input. It will only work if the serial port has no other input connections. For example, you cannot configure command In and XON/XOFF on the same port.

Flow

The flow parameter lets you control data flow from the selected port to a peripheral device such as a printer that supports XON/XOFF data flow. If enabled, the LYNX terminal monitors the XON/XOFF characters and controls data flow to help eliminate buffer overflow problems that can cause printing errors.

- Press **ENTER** at the **Flow Ctrl** prompt.
- At the XON/XOFF prompt, select **Y** to enable the handshake or **N** to disable the handshake. If enabled, the LYNX terminal stops transmission on receipt of the XOFF character (13h) and resumes on receipt of the XON character (11h).

Checksum

Checksum is selectable for continuous output modes only.

Checksum is a method of checking each line of data transmitted by encoding a check digit character at the end of the string. The receiving device must be able to calculate and compare this character to verify that the data is correct.

Checksum is defined as the 2's complement of the seven low-order bits of the binary sum of all characters preceding the checksum including control characters. Bit 8 of the checksum is the parity bit (if enabled) of the seven low-order bits of the checksum character.

- Press **ENTER** at the **Checksum** prompt, then select **Y** or **N** to enable or disable the transmission of the checksum character.

Connection

The LYNX terminal is programmed at the factory for a demand output and a command input for COM1. No other serial connections are preset. The type of connection determines if the both input and output can be configured. If Host or ENQ continuous mode is selected, both input and output are required. In this case, the prompt for input does not appear. If Demand or other continuous output is selected, a separate input mode can be configured for that port.

1. Press **ENTER** at the **Connection** prompt.
2. Press **ENTER** at the **Output?** prompt, to configure the output for this COM port, or press **SELECT** if you wish to configure input for the COM port. The LYNX terminal displays the current data mode for the COM port.
3. Press **ENTER** to accept the current data mode or press **SELECT** to choose a different mode. Options include:

   - Demand
   - Continuous
   - Host
   - None

When interfacing a LYNX terminal in Demand mode to an 8806, be sure to configure Start of Text as the first character of the template. This is done automatically in Continuous mode. Please refer to the Configure Template sub-block.

Demand

- Press **ENTER** at the **Sign Corr** prompt to configure the net sign correction feature (see note at left).
- At the **Sign Cor?** prompt, select **Y** or **N** to enable or disable net sign correction in the demand output print. If enabled, Net Sign Correction compares the weight in the tare register with the current weight on the scale and configures them so the net weight is always positive.

In B revision and earlier software, sign correction setup prompts are located here. In later revisions refer to Tare Operations sub-block.

- Press **ENTER** at the **DP/Comma** prompt, then press **SELECT** to choose comma or decimal point in the serial output data.
- Press **ENTER** at the **Sel Templ** prompt, then select the template to use with demand printing (ptp01, ptp02, both). Templates are custom output formats configured in the Edit Template sub-block.

When "Both" print templates are assigned to a serial connection, ptp01 is used when the scale is in gross mode, and ptp02 is used when the scale is in net mode.

- Continue to Step 4 to program the input connection.

If more than one output connection is set to "Demand" than the applicable prompts: "Use Com1?**N**" and/or "Use Com2?**N**" and/or "Use Com3?**N**" will appear when the ENTER key is pressed. This prompt(s) allow the operator to direct the demand print to a desired port(s).

Continuous

- Press **ENTER** at the **Format** prompt to select a format for the continuous output. You can select either standard or short form. These formats are described in Appendix 1 at the back of this manual.
- Press **ENTER** at the **Status Byt** prompt, then select either standard status bytes or status byte with setpoints. Setpoint status bytes are required when converting the LYNX terminal to a Model 3015 setpoint controller.

- Press **ENTER** at the **Frequency** prompt, then select the frequency at which the continuous output port will transmit data. Options include:
  - A/D Synchronized output after each A/D cycle (approximately 20 Hz for analog load cells and approximately 10 Hz for DigiTOL load cells)
  - ENQ Synchronized (each time an ASCII ENQ is received)
  - User Rate (selectable from 0.1 to 20 Hz, but limited to the actual A/D rate of the load cell type)

    If User Rate is selected, at the **Rate** prompt, enter the desired frequency for the continuous output.
- Continue to Step 4 to program the input connection.

Host

- Press **ENTER** at the **Host** prompt, then select the desired host mode emulation. Options include:
  - 8142 mode
  - 8530 mode
  - SICS (High Precision) mode

    If 8142 or 8530 is selected, at the **Address?** prompt, enter a number (2 to 9) or letter (A-Z) representing the address to use for communications. This allows RS-422 and RS-485 multidropping.

    If SICS is selected, no further parameters need to be configured and the LYNX terminal returns to the Port prompt.

Appendix 2 describes the format, protocol, and commands for Host mode.

If output type is Host, the Input? prompt does not appear.

4. If output type is Demand or Continuous, press **ENTER** at the **Input?** prompt, then select the input mode for the COM port. Options include:
   - Command
   - String
   - None

   Command

   No further parameters need to be configured. The command input mode performs several basic functions based on ASCII control characters received through the serial port. ASCII control characters and the LYNX terminal responses include:

C	Clears the scale from net to gross mode
T	Tares the current weight on the scale
xxxxxT	Enters xxxxx as a preset tare value (include decimal)
P	Initiates a print sequence
Z	Zeros the scale
U	Switches display units

XXXXX can be any number of digits from one increment to scale capacity. Leading spaces or zeros are not required.

String

When responding to a prompt, if an ASCII carriage return is received, the data is entered on the display and automatically steps to the next prompt. If an ASCII carriage return is not received, the data will be entered on the display but will not proceed to the next step. This allows the operator to edit the string input data.

String input is used from another serial device (such as a computer or bar code reader) to input data to the LYNX terminal. Data can be responses to operator prompts or can be used as a tare value when the LYNX terminal is in normal operating mode.

The following parameters must be programmed for the specific type of string input that will be used.

- Press **ENTER** at the **Terminator** prompt to configure parameters for the termination of the string input. String input can be terminated by either timing out after the last character received or when a specific character is received (for example an ASCII line feed character).
- At the **Timeout** prompt, select **Y** or **N** to enable or disable the timeout parameter for string termination.

  If Timeout is Enabled

  - At the **Val?** prompt, enter the number of seconds (0.0 to 9.9) to pass after the last character is received for LYNX terminal to terminate the input string.
  - Press **ENTER** at the **First Char** prompt, then at the **Char#?** prompt, enter the string position representing the first character to be used as the input to the prompt. This allows you to strip off any leading characters that are not part of a response.

    The LYNX terminal recognizes the last character according to length of the string as determined in the Configure Prompts sub-block of the Memory program block.

  If Timeout is Disabled

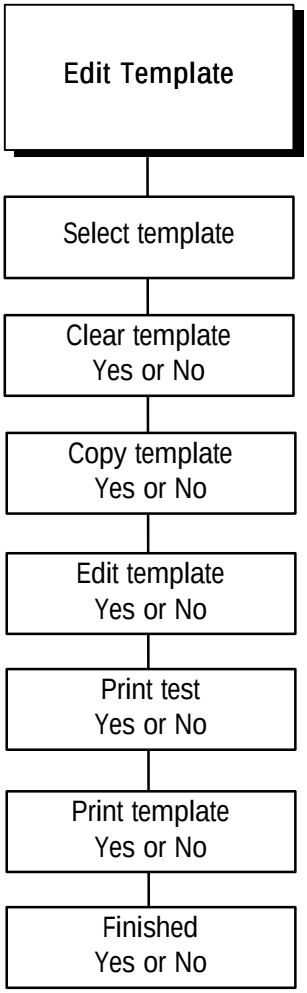
  - At the **Char?** prompt, press **SELECT** to choose the ASCII character that will terminate the string input. You can select the displayed ASCII character or enter in a number, character, or upper case letter from the LYNX terminal keyboard.
  - Press **ENTER** at the **First Char** prompt, then at the **Char#?** prompt, enter the string position representing the first character to be used as the input to the prompt. This allows you to strip off any leading characters that are not part of a response.

    The LYNX terminal recognizes the last character according to length of the string as determined in the Configure Prompts sub-block of the Memory program block.

After programming the input connection, LYNX terminal returns to the COM1? prompt.

5. At the COM1? prompt, configure another serial port or press **ESCAPE** to continue.

2. Configure Template Sub-block



This sub-block lets you define the flexible templates. Templates are preconfigured output strings that are transmitted when a print operation is requested. Appendix 1 lists the LYNX terminal's default templates. You can use the default templates as they are given or edit them to create custom templates.

Templates are composed of elements which are any printed character, special character, or data field. Templates can include weight data, time and date, literal fields (for a name and address), and the prompts and responses from a prompt list. You can also add individual printable ASCII characters such as * or = characters and special ASCII characters (control characters) for extra printer control.

Templates ptp01 and ptp02 can store up to 800 format characters. Template ptp03 can store up to 191 format characters. When configuring a template, you should test-print occasionally so the LYNX terminal will "compile" the template and determine if space remains for more elements. If you overfill the allocated template space, the LYNX terminal responds with the message **Template Overflow** and the data that exceeds the 800 character limit will be lost. See Appendix 1 for information on how to calculate the total number of characters used by a template.

1. Press **ENTER** at the **Edit Templ** prompt to open the sub-block.
2. At the **TPL?** prompt, press **SELECT** to choose the number of the template you wish to edit or create (ptp01, ptp02 or ptp03).

   Template ptp01, ptp02, or both ptp01 and ptp02 may be assigned to any demand output connection. Template ptp03 is used to specify the data format for the last printed data. This data may be unloaded to a host computer using the 8142 host command "Q." If the host connection is unused, ptp03 may be used as an included template in templates ptp01 or ptp02. When template ptp03 is cleared of all data fields and left blank, it provides a data format exactly like the Model 8142 in response to the 8142 host "Q" command.
3. Select the action you want to take with the selected template. Actions include:

   - Clear Template
   - Copy Template
   - Edit Template

   You must respond **Y** or **N** to the prompt for each action.

Template ptp03 is used to specify the data format for the last printed data. This data can be uploaded to a host computer using the 8142 host command "Q." Refer to the description in Appendix 2.

Clear Template

Select **Y** or **N** at the **Clear?** prompt. If **Y**, you must confirm your decision at the **Sure?** prompt.

Copy Template

If you are creating templates that are similar to each other, use the copy and edit template features to save time.

Select **Y** or **N** at the **Copy?** prompt according to whether you want to copy a template or not. If **Y**, select Other or Default, then confirm your selection at the **Sure?** prompt. The current template will be cleared before the new template is copied.

Edit Template

When interfacing a LYNX terminal in Demand mode to an 8806, be sure to configure Start of Text as the first character of the template. This is done automatically in Continuous mode.

Select **Y** or **N** at the **Edit?** prompt if you wish to edit the current template. If **Y**, you can edit, insert, or delete template components.

If **Y** the LYNX terminal displays **Elem # 001** (element number 001) for two seconds indicating that the first element of the template is being recalled, then the actual data for element 001 is displayed. If **End of Template** is displayed, then the template is empty.

If the element number you enter is greater than the last element number in the template, the LYNX terminal automatically displays the last element in the template.

- Press **SELECT** to display the next element in the template. Press **ZERO** to display the previous element in the template. You can access any element in the template using the **SELECT** and **ZERO** keys.

  You can also access specific elements by entering the number of the desired element. After entering the first digit of a new element, the display reads **Element? x** where "x" is the digit just entered. When the complete element number has been entered, press **ENTER** to access that element.
- Press **ENTER** to begin editing the displayed element. You can also begin editing at the end of template position.
- After the **Action?** prompt has been displayed for two seconds, select an editing option.

  EDIT allows you to "replace" the current element with new data. The current element is automatically deleted.

  INSERT allows you to insert a new field or character before the currently displayed element. All following elements are moved back one element number.

  DELETE deletes the current element and moves each remaining element up one element number.

  DEL END deletes all remaining elements from the displayed position to the end of the template.
- If you are editing or inserting, select a data type after the **What?** prompt clears (two seconds). Data can be field information, printable ASCII characters, or special characters.

  FIELD refers to actual data fields available through the LYNX terminal such as time, date, prompts, literals and weight data. Enter a field code defined in the following Field Code tables.

  Although the Field Code table shows codes in lower case, the LYNX terminal accepts field codes entered in upper or lower case.

LYNX DATA FIELD	FIELD CODE	LENGTH
Tare Source Description	ws109	2 A/N “<space> <space>”, “T<space>”, or “PT”
Setpoint Value - SP1	st105	10 A/N
Setpoint Values	st205, st305, stx05*	10 A/N
Preact Value - SP1	st106	10 A/N
Preact Values	st206, st306, stx06*	10 A/N
Dribble Value - SP1	st108	10 A/N
Dribble Value - SP2	st208	10 A/N
Weight Tolerance Value - SP1	st110	10 A/N
Weight Tolerance Value - SP2	st210	10 A/N
Zero Tolerance Value	zt104	10 A/N
Time of Print	jag20	11 A/N
Date of Print	jag19	11 A/N
Consecutive Number	jag09	8 N
Literal 01†	lit01	40 A/N
Literal 02†, etc	lit02, lit..	40 A/N
Prompt 01‡	pmt01	16 A/N
Prompt 02‡, etc	pmt02,pmt..	16 A/N
Prompt 01 Response	var01	As Programmed
Prompt 02 Response, etc	var02, var..	As Programmed
Template 1***	ptp01	As Programmed
Template 2***	ptp02	As Programmed
Accumulator Total	acc01	10 A/N
Accumulator Subtotal	acc02	10 A/N
Current Quick ID	idc02	2 N
Current Record ID	idc03	10 A/N
Current Description	idc04	20 A/N
Current Stored Tare	idc05	10 A/N
Current ID Accumulator	idc06	10 A/N
Current ID Transactions	idc07	8 N

* The setpoint number should be inserted for x.

** pb = pushbutton tare, kb = keyboard (preset) tare.

† Refer to the section entitled Configure Literals Sub-block in the Configure Memory Program Block later in this chapter for more information on entering literals.

‡ Refer to the section entitled Configure Prompts Sub-block in the Configure Memory Program Block later in this chapter for more information on entering prompts.

*** Using a template field code within another template will insert the entire template into the output.

Although the Weight Data field table shows codes in lower case, the LYNX terminal accepts field codes entered in upper or lower case.

* lb/oz weight fields are active only while displaying lb-oz units.

WEIGHT DATA FIELD	FIELD CODE	LENGTH
Displayed Gross Wt.	wt101	12 A/N
Displayed Tare Wt.	ws102	12 A/N
Displayed Net Wt.	wt102	12 A/N
Displayed Wt. Units	wt103	3 A/N
lb/oz Gross Wt.*	wt104	12 A/N
lb/oz Tare Wt.*	ws103	12 A/N
lb/oz Net Wt.*	wt105	12 A/N
Scale Mode (Gross/Net)	ws101	1 A/N (G or N)
Custom Unit Conversion Factor	cs103	8 A/N
Custom Unit Name	cs102	3 A/N
Gross Weight - Main units	wt119	12 A/N
Tare Weight - Main Units	ws112	12 A/N
Net Weight - Main Units	wt120	12 A/N
Main Weight Units	wt121	3 A/N
Gross Weight - Secondary Units	wt122	12 A/N
Tare Weight - Secondary Units	ws113	12 A/N
Net Weight - Secondary Units	wt123	12 A/N
Secondary Weight Units	wt124	3 A/N
Manual Weight Designation	ws114*	9 A/N

Only available when net sign correction is enabled. May be required by some agencies to be printed next to gross weight.

For more information on entering alphanumeric characters, please refer to the section entitled Alphabetical and Special Character Entry in Chapter 4 of this manual.

CHAR refers to normal printable ASCII characters on the LYNX terminal keypad and CR/LF (carriage return and line feed) characters. Enter ASCII characters from the LYNX terminal keypad. CR/LF makes the termination of a printed line faster than selecting each character individually, and allows quick addition of multiple new lines to advance to the end of the page or to a position a line on a page. To choose CR/LF as a character, press **SELECT** at the **Character?** prompt.

At the **Quant?** prompt, enter the number of the selected character to print.

Refer to Appendix 1 for a list of special characters.

SPEC CHAR refers to "special" control characters that are not on the LYNX terminal keypad or non-printable ASCII characters such as ASCII SO (shift out - 0E hex) which may be used for printer control. Special characters also include lower case letters and various punctuation not available on the LYNX terminal keypad. Use the LYNX terminal **SELECT** and **ZERO** keys to scroll through the list of these characters and choose a character.

Use the digit keys to enter the decimal value of any special character 0-255.

At the **Quant?** prompt, enter the number of the selected character to print.

Formatting options allow you to customize the appearance of printed data and helps align data on the page. You can also limit the data field width which can help to eliminate unwanted characters.

At the **Format?** prompt, select the data position (justification) and field width. If field width is less than the code length default specified in the Field Code tables (above), characters will be stripped off automatically. Justification choices include:

DEFAULT prints data as defined by Mettler Toledo default.

LEFT prints data left justified within the field width. At the **Width?** prompt, enter the number of characters to define the field width.

Format options Left, Center, and Right use more memory than Default.

CENTER prints data centered within the field. At the **Width?** prompt, enter the number of characters to define the field width.

RIGHT prints data right justified within the field. At the **Width?** prompt, enter the number of characters to define the field width.

ZERO FILL prints numeric data fields without suppressing leading zeros. If the value is negative, the negative sign will be the left-most character.

In a print template, data fields can now be programmed for "zero fill" format. This is intended for numeric fields only. In this format, leading zeros are not suppressed, and the negative sign always occupies the left most character.

When the element is viewed on the display, the data is shortened to fit in the display area. The following examples illustrate the displayed data format.

Example 1

/wt101 L 15 where:

"/" indicates a LYNX terminal Data Field. The other possibility is "A" for ASCII character.

"wt101" is the gross weight field code.

"L" indicates this field is left justified. Other possibilities are "R" for right and "C" for center.

"15" is the specified field width.

Example 2

A 'G' 001 where:

"A" indicates an ASCII character. The other possibility is "/" for a LYNX terminal Data Field.

"G" is the ASCII character selected.

"001" is the quantity of the "G" character to be transmitted. Printing multiple characters is a quick way to add spacing or create custom printouts. For example, multiple underscores (_) can create a signature line.

4. Press ESCAPE when the template is finished or if you want to "compile" the template.

Print test allows you to check your data output without exiting the template sub-block.

5. At the **Prt Test?** prompt, select **Y** or **N** to initiate or skip a test print of the template. If Y, the data defined by the template will print.

   If more than one port is programmed as capable of printing the test, the LYNX terminal may prompt you to select a specific port for output.

6. At the **Prt Temp?** prompt, select **Y** or **N** to print the template elements. If **Y**, template elements are printed in the shortened format described above.

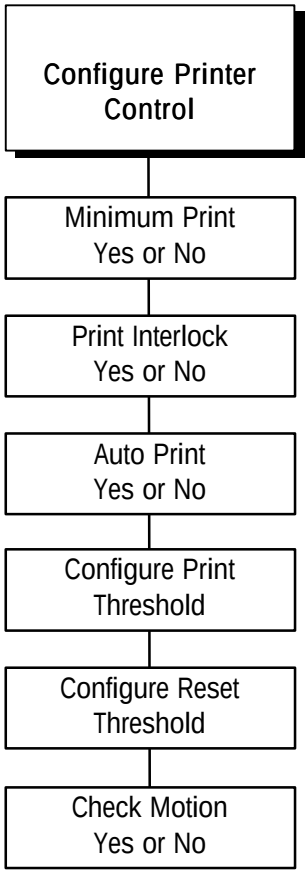
Print template gives a hard-copy record of the template configuration that can be useful for "debugging" a format as you configure the template.

7. If more than one port has been programmed to print this specific template, the LYNX terminal may prompt you to select a specific port for output.

8. At the **Finished?** prompt, select **Y** if you are finished or **N** to return and continue editing this template.

9. Continue to the next sub-block, or exit setup mode.

3. Configure Printer Control Sub-block



This sub-block lets you configure certain parameters that control when and how data is output to a printing device. These parameters apply generally to the LYNX terminal; they are not port specific. To configure the printer control sub-block:

1. Press ENTER at the **Print Ctrl** prompt.

2. At the **Min. Prt?** prompt, select **Y** or **N** to enable or disable minimum print. If enabled, printing is possible only when scale weight exceeds a minimum value. If weight exceeds the threshold value, multiple prints are possible. The LYNX terminal prompts you for the minimum print threshold value.

3. At the **Prt I/L?** prompt, select **Y** or **N** to enable or disable print interlock. If enabled, Print Interlock disallows printing until weight on the scale exceeds a threshold value. Multiple prints are disabled until scale weight falls below then exceeds the threshold value again. The LYNX terminal prompts you for the print interlock threshold and reset values.

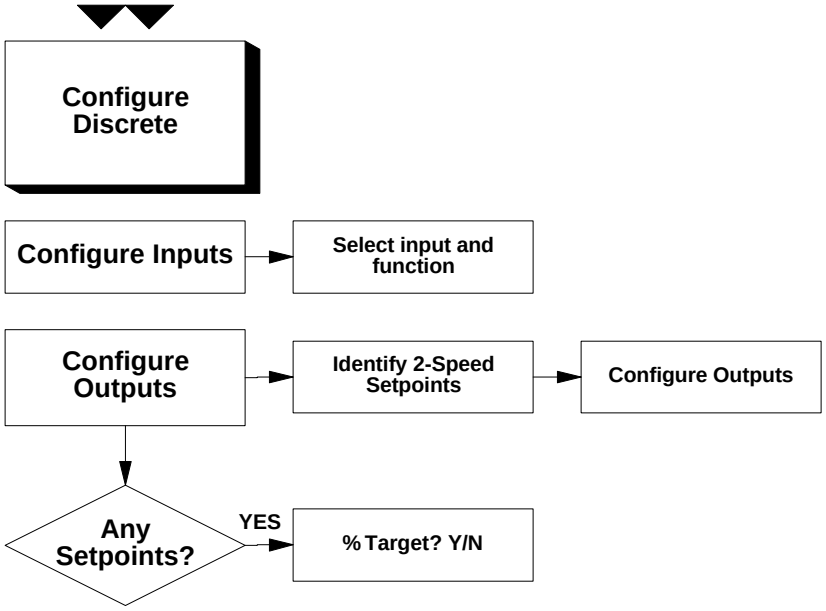
4. At the **Auto Prt?** prompt, select **Y** or **N** to enable or disable automatic printing. If enabled, printing will begin when scale weight is at no-motion above a threshold value. Auto-print requires the weight to drop below the reset threshold before another auto print operation can take place. The LYNX terminal prompts you for auto-print threshold and reset values.

If Enabled

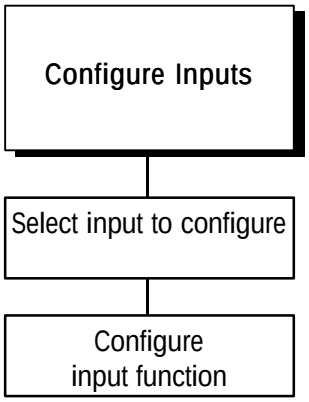
- Press ENTER at the Prt Thres? prompt, then enter a weight value. The LYNX terminal automatically prints when weight on the scale exceeds this threshold value.
- Press ENTER at the Rst Thres? prompt, then enter a weight value. The LYNX terminal automatically resets when weight on the scale falls below this reset value.
- At the Chk Mot? prompt, select Y or N to enable or disable the motion check feature. If enabled, the LYNX terminal waits for the load on the scale to stabilize below the reset value before allowing another print operation above the threshold value.

Discrete Program Block

The Discrete program block lets you configure use of the terminal's three discrete inputs and five discrete outputs.



1. Configure Inputs Sub-block



Note: An "OK to Feed" input is required if a FEED prompt will be used. An "OK to Discharge" input is required if a DSCH prompt will be used. Refer to the Memory Program Block for configuring a prompt list.

Refer to Appendix 3 for a complete explanation of the use of discrete inputs.

This sub-block lets you configure the LYNX terminal's three inputs for the required functionality. Inputs are found on the PAR1 discrete input connector.

To configure inputs:

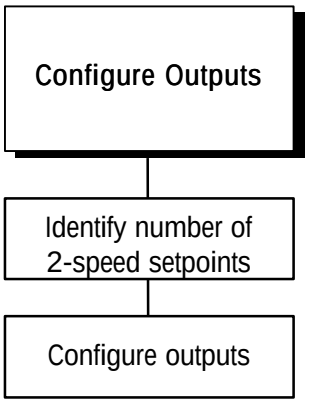
1. Press **ENTER** at the Confg In prompt to access the sub-block.
2. At the **Input? 1** prompt, press **ENTER** to configure Input1, or press **SELECT** to choose input 2 or 3. Press **ENTER** when the desired input is displayed.
3. Press **SELECT** to assign a function for the selected input. Options include:

- Tare
- Clear
- Zero
- Print
- Switch Units
- Blank Display
- Dynamic
- Inhibit Keypad
- X10 Weight
- Accumulator Total
- OK to Feed
- OK to Discharge
- Advance Prompt List *
- None

*This input will also cause the LYNX terminal to jump from the normal weighing mode to the first prompt in a prompt list.

4. Press **ENTER** then repeat steps 2 and 3 for all three discrete inputs. When finished press ESCAPE followed by **SELECT** to continue to the Configure Outputs sub-block.

2. Configure Outputs Sub-block



This sub-block lets you configure the LYNX terminal's five outputs for the required functionality. Outputs are found on the PAR2 discrete output connector. To simplify configuration, you must first select the number of 2-speed setpoints. Depending on the number of 2-speed setpoints, you then select the functions of the remaining outputs.

To configure the outputs:

1. Press **ENTER** at the **Confg Out** prompt to access the sub-block.
2. At the **# - 2 Speed?** prompt, press **ENTER** to accept the displayed quantity, or press **SELECT** to choose the number of 2-speed setpoints (0, 1, or 2). Press **ENTER** when the desired input is displayed.

   If Zero 2-Speed setpoints is selected, the LYNX terminal will advance to step 5 below to permit you to assign each physical output (1-5) to the desired output function.

The following table shows the possibilities:

If a discrete output is assigned as a setpoint, the operator can enter the setpoint values by pressing the MEMORY key or setpoint input can be configured as a step in the Prompt List.

Quantity 2-Speed Setpoints = 0	
Output #	**Function Assigned**
1	Single Speed Setpoint or Assigned Status Output
2	Single Speed Setpoint or Assigned Status Output
3	Single Speed Setpoint or Assigned Status Output
4	Single Speed Setpoint or Assigned Status Output
5	Single Speed Setpoint or Assigned Status Output

3. If one or two 2-speed setpoints are selected, the LYNX terminal requires you to specify information about each setpoint. At the **Source SP1** prompt, press **ENTER** then respond **N** to the **Feed?** prompt if you will not use setpoint 1 as a feed control output in the prompt list or Y if you will use it in the prompt list. Next, press **SELECT** to choose the weight value that will be used as a source for comparison to the setpoint. Your choices are:

The LYNX terminal can provide feed and discharge sequence logic through its Prompt List. You configure the Prompt List in the Memory Program Block.

- Displayed Weight (Net or Gross according to current scale more)
- Gross Weight (regardless of scale mode)
- Net Weight (scale must have a tare)

Next, choose if the setpoint will have a preact value associated with it. Finally, choose if the tolerance function for the setpoint will be a Zero tolerance or a Weight tolerance.

You can enable preact for setpoints if you want to compensate for material delivered after the output is turned off. Preact is subtracted from the setpoint to calculate the point where the output will be turned off.

4. If you choose two two-speed setpoints you must enter the same parameters for SP2 as for SP1 except that SP2 can be used in a prompt list for discharge output control rather than for feed control. Advance to step 6.

   If you choose one two-speed setpoint, the LYNX terminal will display the prompt **Use SP2?.** Respond **N** if you only require a single setpoint or respond **Y** if you require a second setpoint for single-speed feed control.

   If you responded N to the **Use SP2?** prompt, the LYNX terminal will advance to step 5 so you can assign the remaining outputs. The following tables show the output configurations according to your previous choices:

You can specify if the weight tolerance output is controlled relative to zero or to the setpoint.

The SP1 and SP2 display cursors, on the front of the LYNX terminal, will indicate the state of outputs 1 and 2.

Quantity 2-Speed Setpoints = 2	
Output #	Function Assigned
1	Slow Feed, Setpoint 1
2	Fast Feed, Setpoint 1
3	Tolerance, Setpoint 1 or Zero
4	Slow Feed, Setpoint 2
5	Fast Feed, Setpoint 2

Refer to Appendix 3 for a complete explanation of the use of discrete outputs.

Quantity 2-Speed Setpoints = 1 AND Use Setpoint 2 = Y	
Output #	Function Assigned
1	Slow Feed, Setpoint 1
2	Fast Feed, Setpoint 1
3	Tolerance, Setpoint 1, or Zero
4	Feed, Setpoint 2
5	Weight Tolerance, Setpoint 2

Quantity 2-Speed Setpoints = 1 AND Use Setpoint 2 = N	
Output #	Function Assigned
1	Slow Feed, Setpoint 1
2	Fast Feed, Setpoint 1
3	Tolerance, Setpoint 1, or Zero
4	Assigned Status Output
5	Assigned Status Output

5. At the **Output? x** prompt, program the remaining outputs that were not automatically assigned. Press **SELECT** to choose the output to configure, then press **ENTER**. Press **SELECT** again to choose a function. Options include:

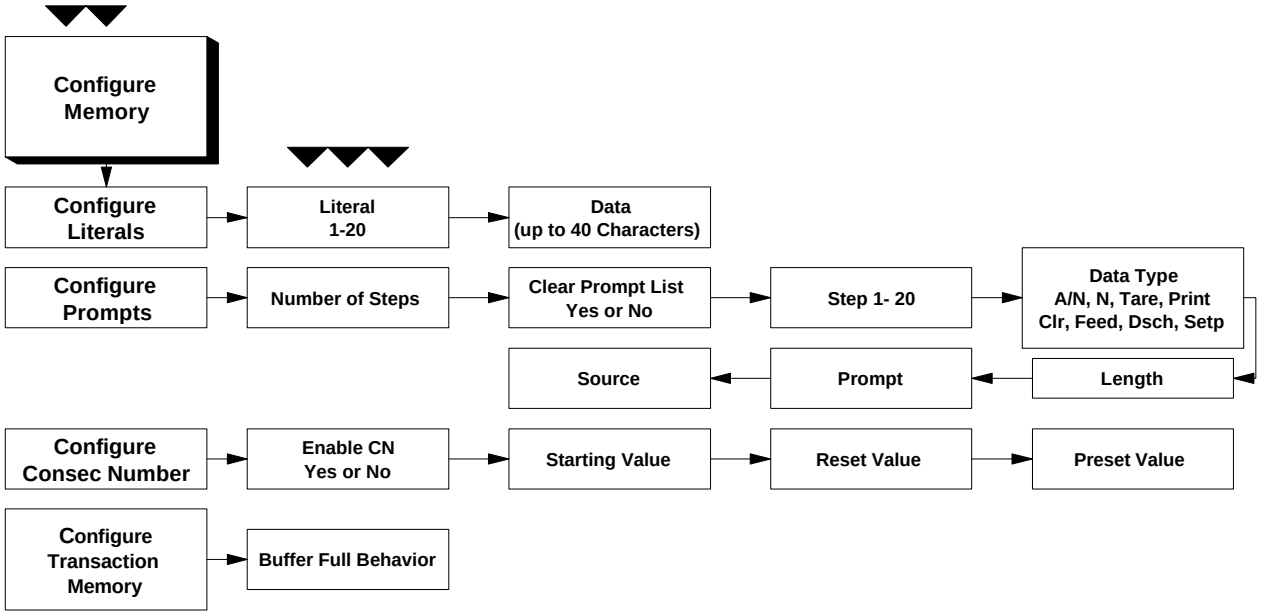
   - Setpoint (single-speed)
   - Net
   - Center of Zero
   - Motion
   - Under Zero
   - Over Capacity

   If a Setpoint output is chosen, you must also set the other parameters associated with the setpoint as discussed in step 3 above. Continue until you have selected and configured all unassigned outputs then press **ESCAPE**.

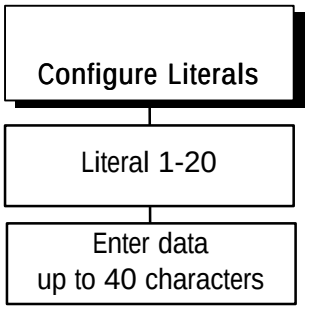
6. If you have configured any outputs as Setpoint outputs, you can designate data entry for the dribble, preact, and tolerance values as a percentage of the setpoint or as a weight value. At the **% Target?** prompt, select **Y** if these values are to be processed as a percent of the setpoint entry. Select **N** if these entries are to be weight values.

Memory Program Block

This program block lets you configure literals, prompt lists, consecutive numbering, and the behavior of the transaction memory table. Prompts and consecutive numbering are accessed when an operator presses the MEMORY key in Normal Operation mode. For more information on the MEMORY key and its function, see its section in Chapter 34. The following diagram describes the Configure Memory program block:



1. Configure Literals Sub-block



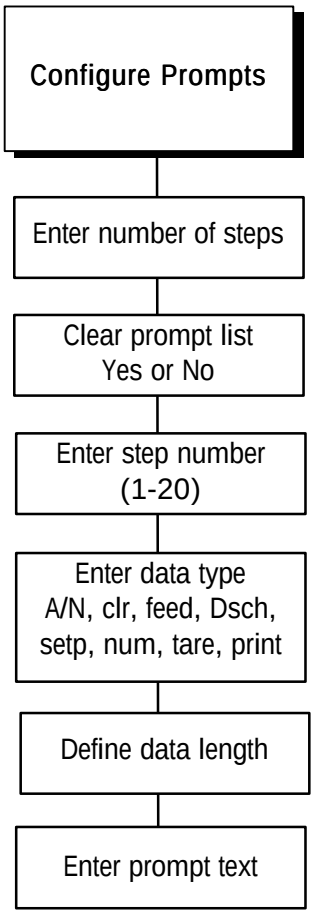
Literals are text strings such as site name or address that can be printed in a template. They can be up to 40 characters in length and are referenced by a field code (see the section entitled Configure Template Sub-block in this chapter). You can program up to 20 literals.

To configure literals:

1. Press ENTER at the Cnfig Literals prompt to open the sub-block.
2. At the **Literal? 1** prompt, enter a number for the literal you are creating or editing (1-20).
3. At the **L01 (or current literal number)** prompt, enter the text for the literal. You can enter up to 40 alpha-numeric characters. For information on entering alphabet characters, please refer to the section entitled Alphabetical Character Entry in Chapter 4.
4. Repeat steps 2 and 3 for each literal you wish to configure.

Press ESCAPE to continue to the next sub-block.

2. Configure Prompts Sub-block



A prompt list displays a written sequence for an operator to perform a task while in Normal Operation mode. You can include up to 20 steps in a prompt list. The LYNX terminal has three preprogrammed prompts:

- Prompt 1: OPERATOR?
- Prompt 2: PART NO?
- Prompt 3: LOCATION?

1. Press **ENTER** at the **Prompts** prompt to open the sub-block.
2. Press **ENTER** at the **# Steps =** prompt. This number tells you how many steps are in the current prompt list.
3. At the **Clr List?** prompt, select **Y** if you wish to clear the existing prompt list and reset the step number to 0, or select **N** if you want to edit or add steps in the existing prompt list.

   If Y, at the **Sure?** prompt, select **Y** or **N** to clear or keep the current prompt list.

   If N, at the **Step 1?** prompt, press **SELECT** to display the step to be edited. If you are creating a new list, begin with Step 1. Press **ENTER** to continue. If editing an existing list, press **SELECT** to step to the next step or **ZERO** to back up. Pressing **CLEAR** will delete the prompt at the current step and moves the following prompts up. Pressing **MEMORY** allows entry of a new prompt ahead of the current prompt. The other prompts will move down.
4. At the **Type?** prompt, press **SELECT** to choose the type of data that will be entered or the action that will be taken from the following table:

Option	Action	Description
A/N	Alpha-Numeric Data Entry	Prompts for keypad or serial input of up to 40 A/N characters
Num	Numeric Data Entry	Prompts for keypad or serial input of up to 8 numbers with decimal point
Clr	Clear the Scale to Gross	Causes the scale to switch from Net to Gross mode
Tare	Tare the Scale	Allows Preset Tare entry, Push button tare, or Automatic tare
Prnt	Print	Causes a print command to be Issued
Feed	Feed a Material to Setpoint	Causes a material to be fed into the Scale to the setpoint 1 amount
Dsch	Discharge the Scale	Causes the scale discharge output to turn on until the scale is empty
SetP	Setpoint Entry	Prompts for keypad input of specified setpoint

Some option choices require input of additional parameters as follows:

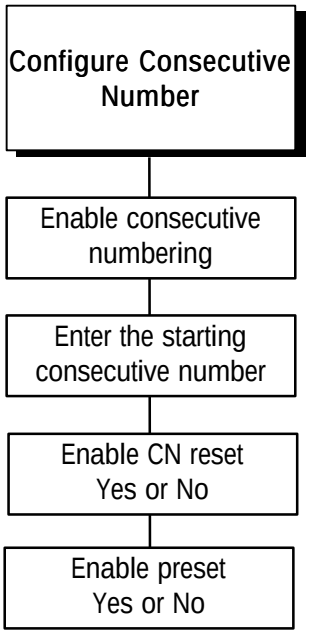
Option	Additional Parameters
A/N	**Length?** – enter the length of the input up to 40 characters * **Prompt?** – enter the prompt for the operator
Num	**Length?** – enter the length of the input up to 8 numbers * **Prompt?** – enter the prompt for the operator
Clr	No additional parameters required
Tare	**Tare?** – press **SELECT** to choose the tare action as: **Tare** – permits push button or preset tare entry **PT** – permits preset tare entry only **Semi** – permits push button tare only **Auto** – cause an automatic tare
Prnt	No additional parameters required
Feed	No additional parameters required
Dsch	No additional parameters required
SetP	**SP Nbr?** – enter the setpoint number (1-5) to be entered **Prompt?** – enter the prompt for the operator

* Enter a length of zero if you wish to use the prompt as a "hold" function and do not expect data input for the prompt.

6. At the **Clr Data?** prompt, select **Y** to enable clearing of the data entered in the prior execution of the prompt or **N** if you wish to retain the last data entered.
7. At the **More?** prompt, select **Y** if you wish to enter more steps into the prompt list or **N** if you are finished editing the list.
8. At the **Loop?** prompt, select **Y** if you want the LYNX terminal to remain in the prompt mode once it is entered, looping from the last prompt to the first prompt until **ESC** is pressed.
9. If No is selected for Loop, at the **Auto Pmt?** prompt, select **Y** if you want the LYNX terminal to automatically execute the prompt list whenever the weight on the scale exceeds a threshold value.
10. If Automatic Prompting Is Enabled
    - At **Pmt Thres?** press **ENTER** to input the weight threshold that will cause the LYNX terminal to jump from the normal weighing mode to the first prompt in the prompt list.
    - At **Rst Thres?** press **ENTER** to input the weight threshold that the scale must pass through to reset automatic prompting for the next cycle.
    - At the **Chk Mot?** prompt, select **Y** if you want the weight on the scale to have to settle to a no-motion state prior to jumping to the prompt list or prior to being reset for the next cycle.

Automatic prompting provides a method of automating LYNX terminal program execution to simplify operator interaction and to eliminate or minimize operator keystrokes!

3. Configure Consecutive Numbering Sub-block

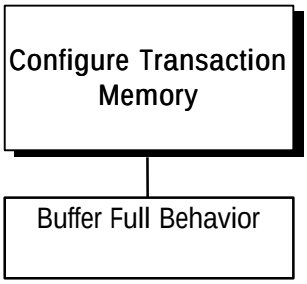


Consecutive numbering is used for sequencing purposes. The LYNX terminal automatically increments the number from a defined starting point. Consecutive numbers can be up to eight digits.

To configure consecutive numbering:

1. Press **ENTER** at the **Cons Numbr** prompt to open the sub-block.
2. At the **Ena CN?** prompt, select **Y** or **N** to enable consecutive numbering.
3. Press **ENTER** at the **Start at:** prompt, then enter the first consecutive number to be used (0-99999999) after a reset.
4. At the **Ena Rst?** prompt, select **Y** or **N** to enable or disable the consecutive number reset. If enabled, the operator can manually reset the consecutive number from the LYNX terminal's keypad.
5. At the **Ena Pre?** prompt, select **Y** or **N** to enable or disable the consecutive number preset feature. If enabled, the operator can manually enter from the keypad a number to be used as the starting consecutive number.
6. Press **ENTER** to continue to the next sub-block or press **ESCAPE** to exit the Configure Memory program block.

4. Configure Transaction Memory



Note that for systems requiring secure data record capture, you should configure this prompt to halt and instruct the operator to notify a designated responsible party if a **Mem Full!** message is displayed.

The LYNX terminal can store transaction data records in a transaction memory buffer to make them available for a host computer to acquire. The transaction memory buffer is 4,090 bytes long. This sub-block allows you to configure the LYNX terminal to behave in a prescribed manner should the buffer become full.

To configure the transaction memory buffer full behavior:

1. Press **ENTER** at the **Trans Mem** prompt to open the sub-block.
2. At the **Full?** prompt, press **SELECT** to choose between these options for the behavior of the LYNX terminal when the transaction memory buffer is full.

Option	Action	Description
None	Continue normal operation	The oldest transaction record will be overwritten and printing will take place.
Warn	Warn the operator that the buffer is full	The operator will be warned. The oldest transaction record will be overwritten. The LYNX will print.
Halt	Warn the operator and inhibit new records, accumulation, and printing	The operator will be warned. A new record will not be written to the buffer, and accumulation and printing will be inhibited.

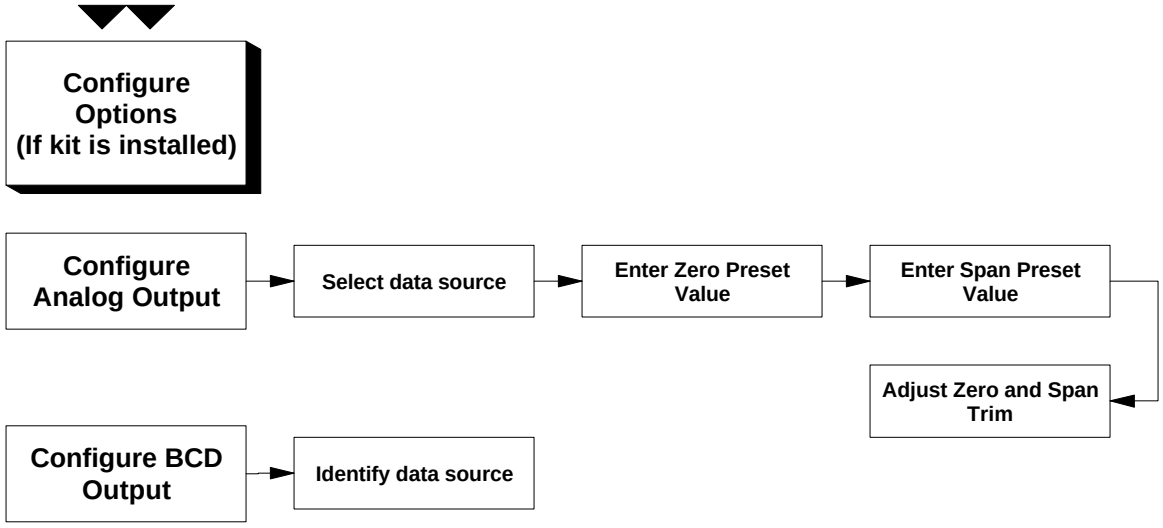
Refer to Appendix 2, Host Commands, to learn how to use a host computer to acquire the data records from the transaction memory buffer.

Configure Options Program Block

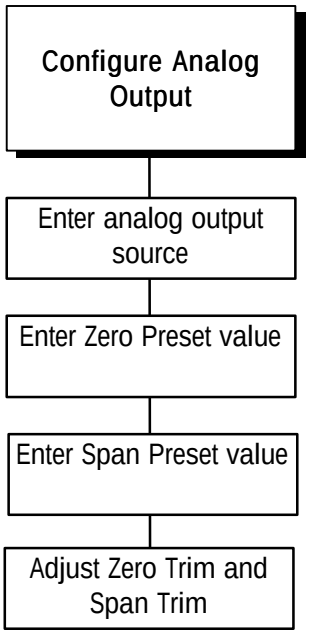
The Configure Options program block lets you configure parameters for the optional Analog Output kit and/or the optional Binary Coded Decimal (BCD) Output kit. This program block appears only if an option kit (either analog output or BCD) is installed, and parameters appear only for the option kit(s) that are installed. For example, if you have installed the BCD Output option kit, the Options program block appears in setup mode showing only parameters for the BCD Output option.

The Analog Output option kit can be installed in the LYNX terminal harsh environment, desk/wall, filling, or the panel mount model. The BCD Output option kit, however, can be installed only in the panel mount LYNX terminal.

The following diagram describes the Options program block:



1. Analog Output Sub-block



The Analog Output option kit provides a 4 to 20 mA, 0 to 5 VDC, or 0 to 10 VDC analog signal for gross weight or displayed weight. The Analog Output sub-block lets you select the data source and calibrate analog zero and full-scale values. The LYNX terminal must be calibrated before making any Analog Output adjustments.

To configure the Analog Output option:

1. Press **ENTER** at the **Analog** prompt to access the sub-block.
2. Press **ENTER** at the **Source** prompt, then select gross weight display or displayed weight output as the data source for analog output.
3. Press **ENTER** at the **Zero Preset** prompt, then enter a weight value for the analog output to use as the analog zero value. You must enter a numeric value for zero preset.

   The default value for Zero Preset is appropriate only for the default scale build from the factory. You must enter an appropriate value based on your scale build.
4. Press **ENTER** at the **Span Preset** prompt, then enter a weight value for the analog output to use as the full scale value. The default value Span Preset is appropriate only for the default scale build from the factory. You must enter an appropriate value based on your scale build.

The coarse tuning adjustment increment is approximately ± 0.01.

5. Press **ENTER** at the **Zero Trim** prompt. The zero output factors may now be trimmed either with or without test weights. When entering the trim section, the user is asked **Use Weights?** If "Yes," the continuously updating scale weight is taken as input data and trim is adjusted based on that value. If "No," trim is accomplished using a constant value for zero. At the **Coarse** prompt, press the **MEMORY** key to increase the output, or press the **FUNCTION** key to decrease the output. Press **ENTER** when the desired adjustment is displayed.

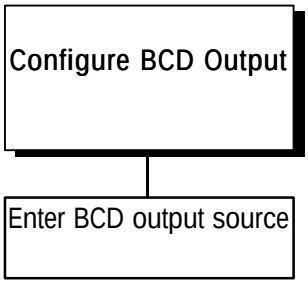
The fine tuning adjustment increment is approximately ± 0.01.

6. At the **Fine** prompt, press the **MEMORY** key to increase the output, or press the **FUNCTION** key to decrease the output. Press **ENTER** when the desired adjustment is displayed.

The target weight must be on the scale before making Span Trim adjustments when "Use Weights? **Y**" is selected..

7. Press **ENTER** at the **Span Trim** prompt. The full scale output factors may now be trimmed either with or without test weights. When entering the trim section, the user is asked **Use Weights?** If "Yes," the continuously updating scale weight is taken as input data and trim is adjusted based on that value. If "No," trim is accomplished using a constant value for full scale. At the **Coarse** prompt, press the **MEMORY** key to increase the output, or press the **FUNCTION** key to decrease the output. Press **ENTER** when the desired adjustment is displayed.
8. At the **Fine** prompt, press the **MEMORY** key to increase the output, or press the **FUNCTION** key to decrease the output. Press **ENTER** when the desired adjustment is displayed.

2. BCD Output Sub-block



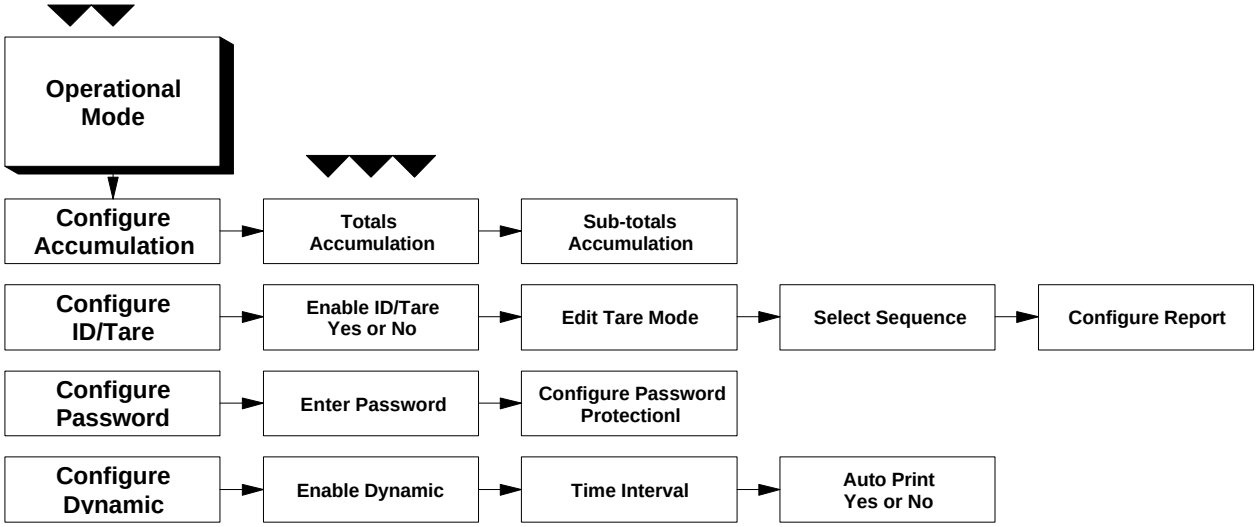
The BCD Output option kit provides up to six decades of TTL data. This sub-block lets you select the source data for BCD Output. To configure the sub-block:

1. Press ENTER at the BCD prompt.
2. Press ENTER at the Source prompt, then select gross weight output or displayed weight output.

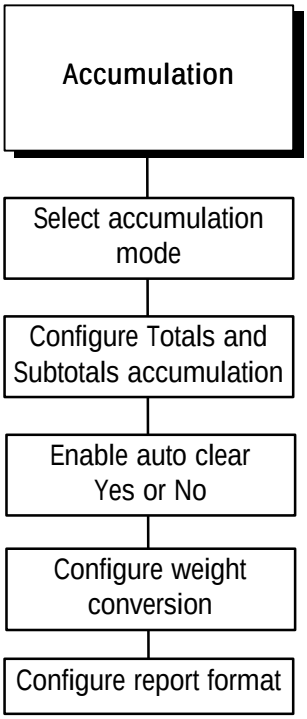
Operational Mode Program Block

The Operational Mode program block lets you configure the LYNX terminal for weight accumulation (total and sub-total registers), dynamic weighing (unstable loads such as livestock), or ID/Tare storage and recall.

The following diagram describes this program block:



1. Accumulate Sub-block



The Accumulate sub-block lets you configure the Total and Sub-total accumulator. This feature allows accumulation of multiple weighings in a register. The accumulated weight can be selected as net weight (if tare has been entered), gross weight, or displayed weight (gross or net). Accumulation occurs when the LYNX terminal receives and performs a print request. Accumulation can also be used with dynamic weighing.

To configure the sub-block:

1. Press **ENTER** at the **Accumulate** prompt, then press **ENTER** again at the **Accum Mode** prompt.
2. Select the type of accumulation. Options include:
   - None
   - Net weight
   - Gross weight
   - Displayed weight

   If ID/Tare Permanent Tare Total and Number of Transactions are desired then Accumulation must be set to Net, Gross or Displayed Weight.

   If "None" is selected, then operation proceeds to the ID/Tare sub-block.
3. Press **ENTER** at the **Total** prompt to configure the accumulator auto clear total feature. At the **AutoClr?** prompt select **Y** or **N** to enable or disable auto clear the total and subtotal values (if enabled) after printing.
4. Press **ENTER** at the **Subtotal** prompt to configure the subtotal accumulator. At the **Ena Sub?** prompt, select **Y** or **N** to enable or disable the subtotal accumulator.

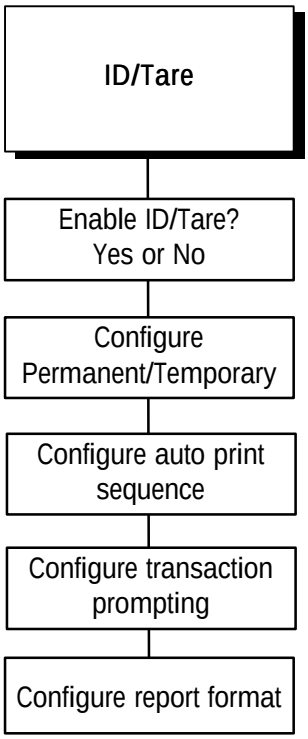
   If enabled, press **SELECT** at the **Auto Clr?** prompt to enable or disable the subtotal accumulator auto clear after print. **Y** will cause the accumulator to clear after printing the accumulated totals.

LYNX terminal uses the primary weight unit (calibration unit) for accumulation.

5. At the **Conv Wt?** prompt select **Y** or **N** to enable or disable weight conversion if secondary units are used. If enabled, the LYNX terminal converts the displayed secondary weight unit to the primary weight unit for accumulation. If disabled, secondary weight units are ignored and are not accumulated.
6. Press **ENTER** at the **Report Fmt** prompt, then select the fields to include in the printed accumulation report. You must respond **Y** or **N** to each report field option. You can include:
   - Literals 9 and/or 10
   - Time
   - Date
   - Last consecutive number
   - Subtotal

   Please refer to Appendix 1 for a sample accumulation totals report.

2. ID/Tare Sub-block



The ID Tare sub-block lets you configure the stored weight features, configure the print and prompt sequence, and configure the report format. The Permanent ID/Tare entry and recall feature is useful when a tare weight will be used repeatedly (such as the same box used many times on the same scale). Temporary ID/Tare is useful when a tare weight will be used once for a single transaction.

1. Press **ENTER** at the **ID/Tare** prompt to access this sub-block.
2. At the **Ena ID/T?** prompt, select **Y** or **N** to enable or disable permanent and temporary tare recall.
3. If enabled, press **ENTER** at the **Edit Tare** prompt, then select the tare register to configure. Options include:
   - Permanent
   - Temporary

   If Permanent

   - At the **ManEntry?** prompt, select "**Y**" to enable entry/edit of a permanent tare (see the memory key description in Chapter 4) or select "**N**" to disable entry/edit of a permanent tare.

     Note that selecting "ManEntry?**N**" does not disable previously entered permanent tares but instead prevents the operator from changing the permanent tare values.

   - At the **Auto Clr?** prompt, select **Y** or **N** to enable or disable automatic clearing of a permanent record. If enabled, the LYNX terminal will automatically clear the permanent record after a predetermined number of transactions has occurred.

   - At the **Trigger?** prompt, select **Y** or **N** to enable or disable the prompt for the number of transactions required before clearing a permanent tare. If enabled, this forces the operator to reenter permanent tare values after a specific number of transactions.

     The Trigger feature can be used for applications when it is necessary to update permanent tare information due to fuel loss, dirt build-up, etc.

     If Trigger is enabled, press **ENTER** at the **Transact** prompt. Then at the **# Trans** prompt, enter the number of transactions to take place before a permanent tare is cleared and the operator must reenter permanently stored tare values.

   If Temporary

   - At the **Auto ID?** prompt, select **Y** or **N** to enable or disable the Auto ID feature. If enabled, the LYNX terminal automatically assigns a temporary tare ID number and will briefly display the assigned ID at time of storage. If "**N**" is selected, manually entered ID numbers are still possible, providing the selected memory location is empty.

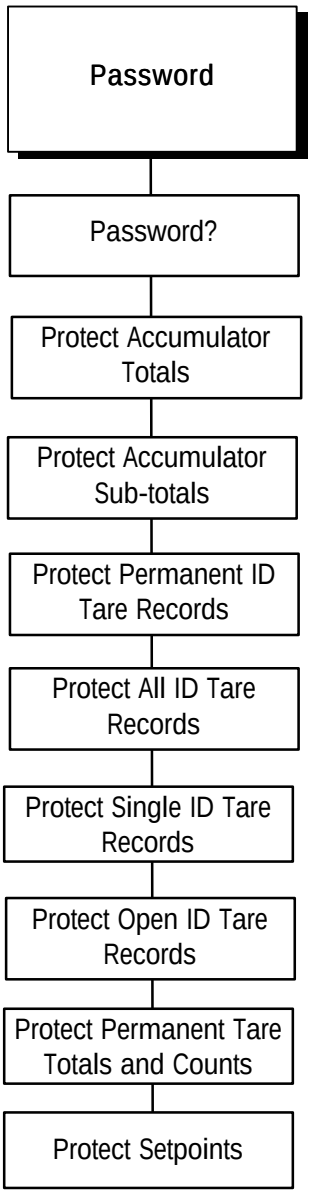
4. Press **ENTER** at the **Sequence** prompt, then configure the auto print capability.

- At the auto print **Inbound?** prompt, select **Y** or **N** to enable or disable auto print after the ID is entered and weight is put on the scale for an inbound transaction.
- At the auto print **Outbound?** prompt, select **Y** or **N** to enable or disable auto print after the ID is entered and weight is put on the scale for an outbound transaction.
- Press **ENTER** at the **Prmpt Desc** prompt, then determine when the description prompt occurs. Options include:
  - In only
  - Out only
  - In and out
  - None

  Any selection other than "None" will enable display of the current record description and editing of the description, if desired.
- Press **ENTER** at the **PromptList** prompt, then select the appropriate transaction type. This allows you to automatically use the predefined prompt list during transactions. Options include:
  - In only
  - Out only
  - In and out
  - None
- Press **ENTER** at the **Report Fmt** prompt, then select **Y** or **N** to define the fields to include in the printed report. Field options include:
  - ID
  - Record ID
  - Description—respond No if using a 40 column printer
  - Tare (permanent records)
  - Accum (permanent records only)
  - Transactions (permanent records only)
  - Weight (temporary records)

5. Continue to the next sub-block or exit setup mode.

3. Password Sub-block



For more information on entering alpha-numeric characters, please refer to the section entitled Alphabetical and Special Character Entry in Chapter 4 of this manual.

This sub-block lets you create and enable a password that can be used to protect:

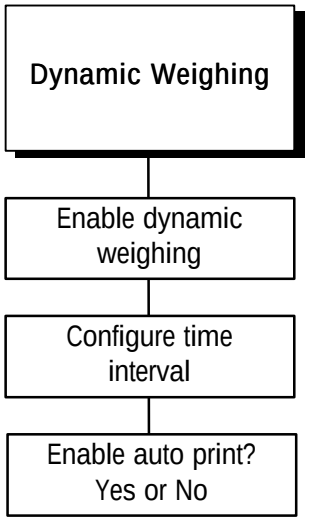
- Accumulator totals
- Accumulator sub-totals
- Permanent ID tare records
- All ID tare records (including temporary)
- Single ID tare records (as desired in normal operating mode)
- Open ID tare records (temporary)
- Permanent tare totals and counts
- Setpoints

More information on using these features can be found in Chapter 4 of this manual.

To configure the Password sub-block:

1. Press **ENTER** at the **Password** prompt, then press **ENTER** again at the **Password?** prompt. The display becomes blank to accommodate password entry.
2. Use the numeric keys to enter a password. The password can be up to eight alpha-numeric characters.
3. At the **Prot Tot?** prompt, select **Y** or **N** to protect or unprotect accumulator totals.
4. At the **Prot ST?** prompt, select **Y** or **N** to protect or unprotect accumulator sub-totals.
5. At the **Prot Tr?** prompt, select **Y** or **N** to protect or permanent ID tare records.
6. At the **Prot IDn?** prompt, select **Y** or **N** to protect or unprotect all ID tare records.
7. At the **Prot ID1?** prompt, select **Y** or **N** to protect or unprotect single ID tare records.
8. At the **Prot ID_?** prompt, select **Y** or **N** to protect or unprotect open ID tare records.
9. At the **Tare Tot?** prompt, select **Y** or **N** to protect or unprotect tare totals and counts.
10. At the **Prot SP?** prompt, select **Y** or **N** to protect or unprotect the setpoint entry.

4. Dynamic Sub-block



The update rate for an analog load cell system is 20 updates per second. The rate for DigiTOL scales is between 5 and 7 updates per second.

If auto print is disabled, the operator can still print the dynamic weight manually when the weight is displayed.

The Dynamic sub-block allows accurate weighing and recording of loads that are not stable such as livestock. Dynamic weighing mode averages readings for a predetermined time interval, then displays and prints the average. Dynamic weighing can also be used with the accumulation feature.

1. Press **ENTER** at the **Dynamic** prompt to access the sub-block.
2. At the **Ena Dyn?** prompt, select **Y** or **N** to enable or disable dynamic weighing.

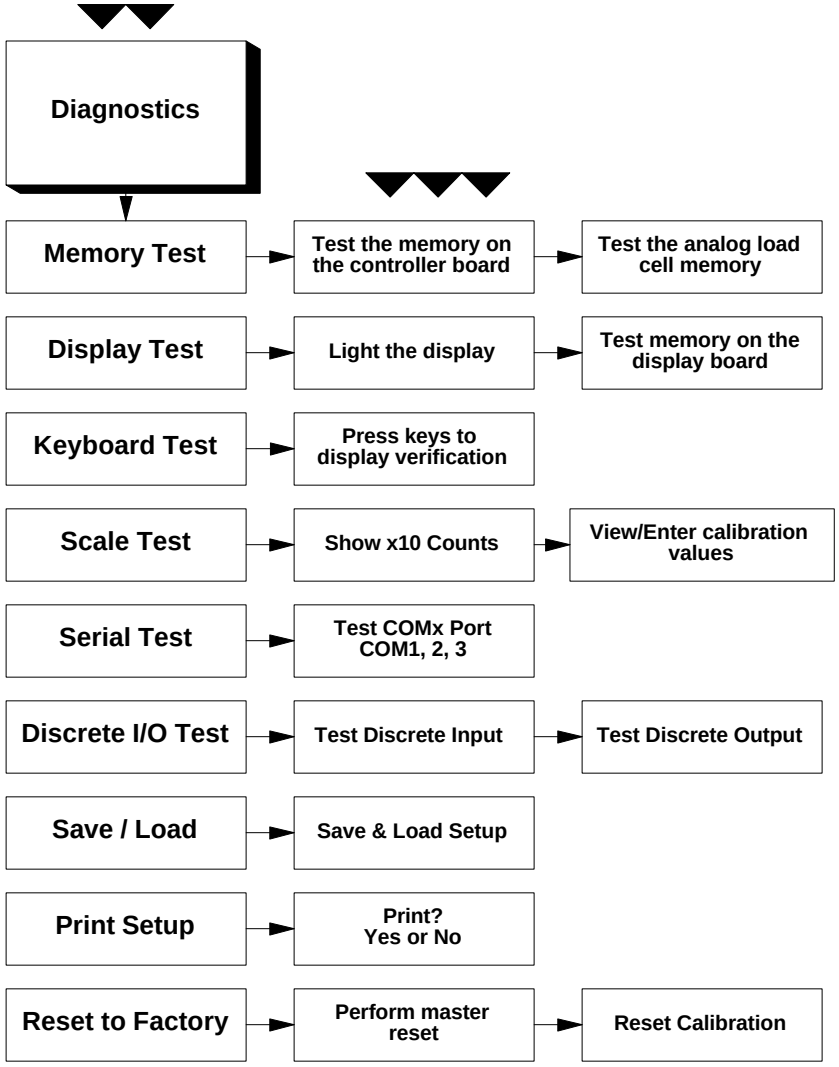
   If Enabled

   - Press **ENTER** at the **Time Intrv** prompt, then at the **Time?** prompt enter the number of seconds to pass before the LYNX terminal displays scale weight. This is the sampling period. Values from one to 10 seconds are valid.
   - At the **Auto Prt?** prompt, select **Y** or **N** to enable or disable the auto print feature. If enabled, the LYNX terminal prints the dynamic weight at the end of the cycle. If disabled, dynamic weight is displayed only.
3. Continue to the next program block or exit setup mode.

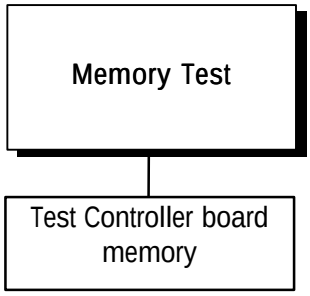
Diagnostics and Maintenance Program Block

Every LYNX industrial terminal can perform a series of diagnostic and maintenance tests. These tests detect problems if they occur and perform regular maintenance testing. The tests are done through this block while in the setup mode.

The following diagram describes this block:



1. Memory Test Sub-block



The Memory Test sub-block tests the terminal's internal memory. These diagnostics test the Flash memory, RAM, and EEPROM on the Controller board. The results of the memory tests are displayed on the terminal.

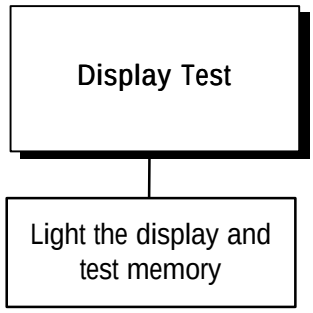
To execute the memory tests:

1. Press **ENTER** at the **Memory** prompt.

   The LYNX terminal automatically tests memory on the Controller board. The terminal displays the Controller PCB software revision and part number, then tests ROM, RAM, and EEPROM. As the tests are complete, the terminal displays the results.

2. Continue to the next sub-block or exit the setup mode.

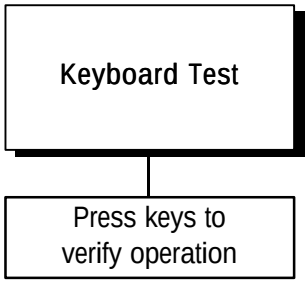
2. Display Test Sub-block



This sub-block tests the terminal's display and tests display ROM and RAM.

1. Press **ENTER** at the **Display** prompt to begin the display test. The LYNX terminal tests the display by lighting each segment for visual inspection. The terminal then displays the Display PCB software revision and part number and tests display ROM and RAM. Test results are displayed when finished.
2. When the test is finished, continue to the next sub-block or exit the setup mode.

3. Keyboard Test Sub-block



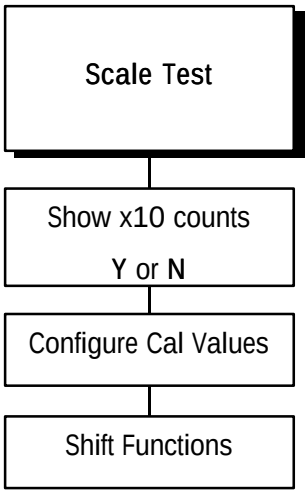
The keyboard test verifies the operation of each key on the LYNX terminal keypad.

1. Press **ENTER** at the **Keyboard** prompt to initiate the test. The LYNX terminal displays the message **Exit w/ ESC** indicating that you can press **ESCAPE** to exit the keyboard test.
2. Press each key on the LYNX terminal keypad. If the depressed key works, the key name is displayed. If the depressed key does not work, the terminal does not respond.

   For example, to test the **MEMORY** key, press **MEMORY** on the keypad. If it works properly, the display reads **Memory**. If the **MEMORY** key is inoperative, the display remains unchanged.

3. Repeat step 2 to test as many keys as you like.
4. When finished, exit the keyboard test by pressing **ESCAPE**.

4. Scale Test Sub-block



This sub-block tests the stability of the scale with regard to the environment and calibration. Scale weight is displayed at a finer resolution than the calibrated increment resolution.

1. Press **ENTER** at the **Scale** prompt, then press **ENTER** at the **Expand Wt** prompt.

   At the **x10 Cnts?** prompt, select **Y** or **N** to show scale resolution ten times higher than normal while performing the scale test. This higher resolution indicates the accuracy of the weight display and if calibration is needed. This procedure also tests for environmental factors affecting the accuracy.

   If you select **Y**, continue to the next sub-block. If you select **N**, continue to Step 3 below. Press **ESCAPE** to exit the x10 mode.

2. Press **ENTER** at the **Cal Values** prompt to view or enter calibration values for the LYNX terminal. the calibration values of one scale can be applied to a new Controller PCB by manually entering the values.

   - Press **ENTER** at the **Zero Cnts** prompt to display the current calibration counts at zero. If desired, enter a zero count value.

   If Linearity Correction is Enabled:

   - Press **ENTER** at the **Mid Weight** prompt to display the last test weight used for mid weight calibration. Enter a new value if desired.
   - Press **ENTER** at the **Mid Count** prompt to display the current calibration counts at mid weight. Enter a new value if desired.
   - Press **ENTER** at the **Hi Weight** prompt to display the last test weight used for high weight calibration. Enter a new high scale weight value if desired.
   - Press **ENTER** at the **Hi Counts** prompt to display the current calibration counts at high weight. Enter a new value if desired.

   If DigiTOL J-Box is Selected:

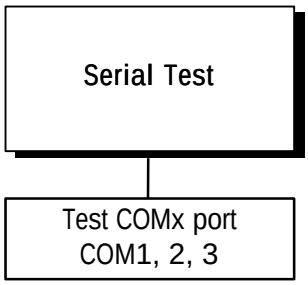
   - Press **ENTER** at the **Shift Cons** prompt to display the shift constants for the DigiTOL junction box. Enter a new shift constant value for each load cell (1 through 4) if desired.

4. Press **ENTER** at the **LC Counts** prompt (DigiTOL scales only) to display the raw counts value for each cell (C1 - C4).
5. Press **ENTER** at **Reset Shft** prompt to return the shift adjustment factors for a DigiTOL J-Box to 1.0. This prompt only appears if the scale selected is DigiTOL J-Box.

   At the **Sure?** prompt, select **Y** or **N** to confirm or abort the reset operation.
6. Continue to the next sub-block or exit the setup mode.

If the scale type is DigiTOL J-Box and linearity correction is enabled, Mid Weight and Mid Counts are displayed. Press ENTER to accept the values.

5. Serial I/O Test Sub-block



The Serial Test sub-block tests the serial I/O ports. You can transmit a test string of data out from a designated port, or you can receive a string of input data. The input data scrolls across the display as received. You may see special characters representing control characters in the test string. This serial test is useful in installation and terminal and hardware diagnostics.

1. Press **ENTER** at the **Serial I/O** prompt to test serial ports.
2. At the **Test?** prompt, press **SELECT** to choose the serial port you wish to test (COM1, COM2, or COM3).

   The display reads Test COMx: until a serial input is received. When input is received, the characters are displayed. The LYNX terminal is constantly outputting the string COMx NN <CR> <LF> where x is the COM port number and NN is a transmission number beginning at 00 and counting through 99.

   The serial test cannot test COM3 if it is associated with a DigiTOL scale. In this case, change the DigiTOL scale type to Analog or None through the Scale Interface program block before performing a serial test.

   <CR> is an ASCII carriage return code. <LF> is an ASCII line feed code.

   If a jumper wire is placed between the transmit and receive terminals on the serial port being tested, you can test both the input and output of a port and view the string of data being transmitted on the display.

   The following diagram shows how to connect the output to the input for the serial ports and all types of communication. Testing COM1 using RS-485 is not possible.

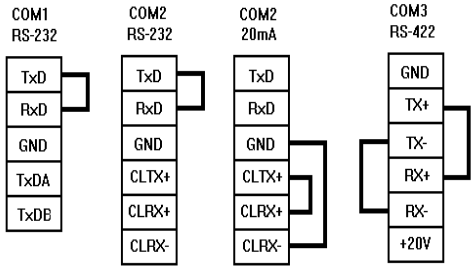


Figure 2-1 Serial Test Jumpers

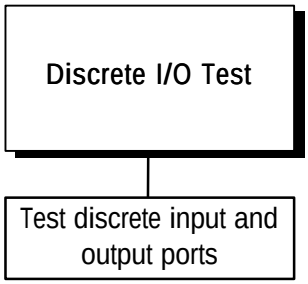
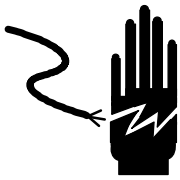
3. Press **ESCAPE** to exit the serial test when you are finished.
4. Repeat steps 2 and 3 to test additional COM ports.
5. Continue to the next sub-block or exit the setup mode.

6. Discrete I/O Test Sub-block



The Discrete I/O Test sub-block tests the discrete I/O ports. The test can "turn on" each output and monitors inputs. The discrete I/O test is useful in installation and terminal and hardware diagnostics. See Appendix 3 for more information on discrete I/O ports.

1. Press ENTER at the Discrt I/O prompt to access the sub-block. The display will flash **"!Warning!"** four times before prompting "Sure?N." If it is safe to proceed with a discrete output test, press SELECT to change the display to "Sure?Y" and then ENTER to proceed. Otherwise press ENTER to skip the Discrete I/O test.
2. At the Test? prompt, select the desired port to test. You can press ENTER to test the inputs for PAR1, or the outputs at PAR2.



⚠ WARNING

This test allows you to turn the outputs ON and OFF from the LYNX terminal keyboard. It is totally unrelated to the weight. If electrical equipment is connected to the output of the LYNX terminal during this test, it may start automatically. Make sure that all appropriate precautions have been taken to prevent personal injury during this test. Mettler Toledo suggests unplugging the Discrete I/O connector from the rear of the LYNX terminal and using LED's or a volt meter to verify correct operation of these outputs.

Discrete Input

The display will read P1 = FFF indicating that the three discrete inputs are all false or "OFF." When one of the inputs is held to logic ground for 100 ms or longer, the "F" will change to a "T" to indicate a true or "ON" condition.

- When finished, press ESCAPE to exit the test routine for the discrete inputs.

Discrete Output

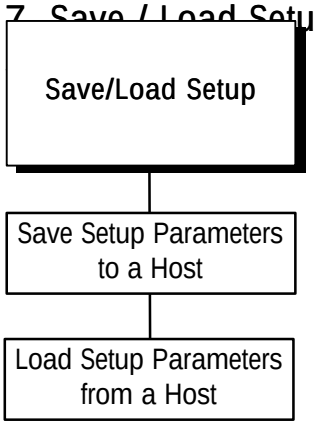
The display will read P2 = 00000] indicating that the five discrete outputs are all logic 0 or "OFF". The first digit will be blinking indicating that output 1 is the active output.

After testing, remember to change the scale type back to DigiTOL and verify that calibration is correct by applying weight to the scale.

- To turn this output on, press the number "1" key. Pressing "0" returns this output to the "OFF" condition. To move to the next output (output 2), press SELECT. The second digit now blinks. Each of the five outputs can be turned "ON" or "OFF" using this method.
- When done, press ESCAPE to exit the test routine for the discrete outputs.

3. Press ESCAPE to exit the parallel I/O test and continue to the next sub-block, or exit the setup mode.

7. Save / Load Setup



This sub-block allows saving from the LYNX terminal and loading to the LYNX terminal all setup parameters using a host device, such as a PC, connected to the LYNX terminal COM1 port. The LYNX terminal port COM1 must be configured to 2400 baud to correctly perform the "Load" function from the host (see the Serial Interface program block). The "Save" function baud rate is limited by that of the other device connected to COM1.

The Save/Load data format is ASCII text which can be transferred by the DOS *.Bat files shown below which use the file name LYNX.TXT for the setup file. Any commercially available data communication program running under DOS or Windows that supports a "text file" transfer protocol may also be used.

To save the LYNX terminal setup to a host:

1. Press ENTER at the **Save Setup** prompt.
2. The LYNX terminal will display **Saving...** while the data is being transferred. After the transfer is complete, the display will read **Saved xxx** with xxx representing the number of setup fields successfully transferred. Press any key to acknowledge this message and return to the save/load sub-block.

If using a PC running DOS, the following batch command file, save.bat, may be run from the DOS prompt:

```
MODE COM1: BAUD=2400 PARITY=E DATA=7 STOP=1 RETRY=P COPY
COM1: LYNX.TXT
```

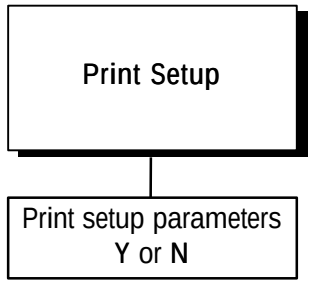
To load the LYNX terminal setup from a host:

1. Press ENTER at the **Load Setup** prompt.
2. The LYNX terminal will display **Loading...** while the data is being transferred. After the transfer is complete, the display will read **Loaded xxx** with xxx representing the number of setup fields successfully transferred. Press any key to acknowledge this message and return to the save/load sub-block.

If using a PC running DOS, the following batch command file, load.bat, may be run from the DOS prompt:

```
MODE COM1: BAUD=2400 PARITY=E DATA=7 STOP=1 RETRY=P COPY
LYNX.TXT COM1:
```

8. Print Setup Sub-block



The **Comx?** prompt appears only if multiple demand connections exist.

You must have a Demand port configured to print setup.

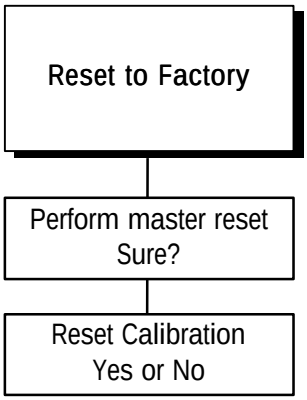
The Print Setup sub-block prints the terminal setup information as it is defined in the program blocks. It may be useful to have a hard-copy of each terminal's setup parameters as back-up.

Print setup data will be sent out the port selected for demand output.

1. Press **ENTER** at the **Setup** prompt. If multiple serial ports have been programmed, the LYNX terminal prompts where to send the test data.
2. At the Use **Comx?** prompt, select one port to receive test data. Only one port can be configured as **Y**.
3. At the **Print?** prompt, select **Y** at the **Print?** prompt to print the setup parameters as defined in the program blocks. If you do not want to print the setup, press **ENTER** to select **N**.

   Setup data is printed in a 40 column format that is compatible with the Mettler Toledo 8856 Strip Printer. A standard 80 column printer, such as the Mettler Toledo model 8845, will also work. Label printers are not acceptable devices for printing this information because there are many lines of data.
4. Continue to the next sub-block or exit the setup mode.

9. Reset to Factory Sub-block



The Reset to Factory sub-block allows you to perform a master reset which returns all of the parameters for all program blocks to their original settings.

To perform a master reset:

1. Press **ENTER** at the **Factry Rst** prompt.
2. Select **Y** at the **Sure?** prompt to confirm your intention to reset, or select **N** to exit without resetting all parameters.

   If Y

   - At the **Rst Cal?** prompt, select the default **N** to reset all parameters **except** calibration. Select **Y** to reset all parameters **including** the scale calibration parameters.

     If you choose to reset the calibration values, the current scale capacity, increment size, and span and zero values will all be lost and scale recalibration will be required.

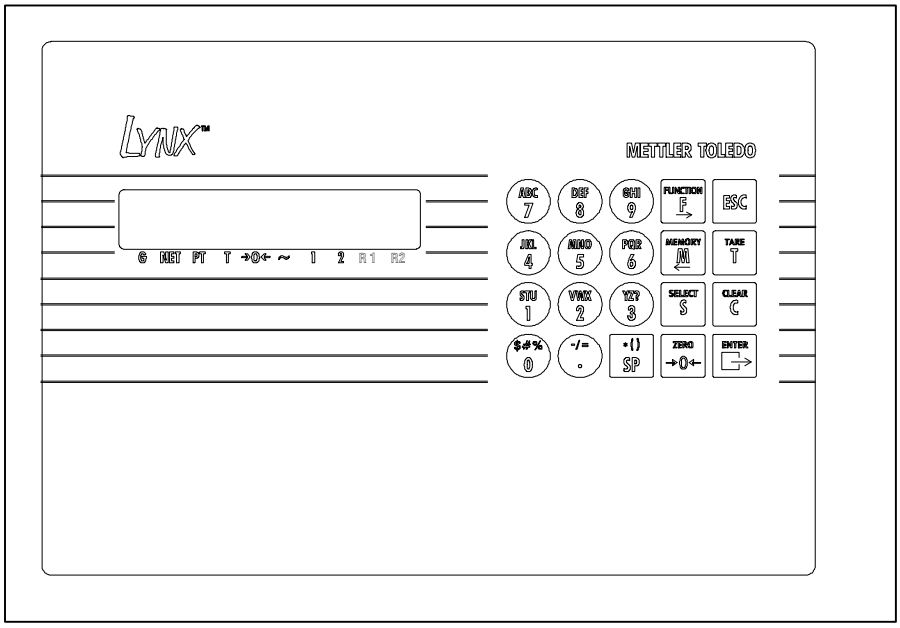
     The LYNX terminal displays the message **Resetting** and all parameters (except print templates) are returned to factory settings.
3. After resetting, the LYNX terminal will perform its normal power-up sequence.

3 LYNX Operations

This chapter provides general information on the LYNX terminal and its functions.

LYNX Display Area

The LYNX terminal has a single alpha-numeric display where scale data and operational messages are presented. The display is pictured below:



The LYNX terminal has a 10 character alpha-numeric display that can display letters and numbers. Each character has a comma and decimal point associated with it.

The display indicates scale weight unless you are in setup mode or using prompting. Error messages are displayed as they occur. Annunciators point to labels in the legend directly below the display area. Annunciators indicate:

- **Weighing Mode** (Gross or **NET**)
  The LYNX terminal will be in net mode when a tare is active. Tare can be entered as a Preset Tare value or may be automatically acquired when you press the **TARE** key. Tare can also be entered through an interface. If no tare is active, the LYNX terminal will be in gross mode.
- **Type of Tare (P**reset Tare **or** Tare**)**
  The preset tare (PT) annunciator indicates a preset tare has been recalled and

displayed. Preset tare is entered manually using the numeric keys. Preset tare is also referred to as keyboard tare or manual tare.

The Tare (T) annunciator indicates that a pushbutton tare or automatic tare has been recalled and displayed. You can perform a pushbutton tare by pressing **TARE**. If Auto Tare is enabled in setup, tare can be taken automatically when a container is placed on the scale.

- **Center-of-Zero (→0←)**
  The center-of-zero annunciator indicates that the scale is within ± 1/4 increment of gross zero.
- **Scale Instability (~)**
  The scale instability annunciator indicates that the scale is in motion. It will turn off when the scale is stable. The sensitivity of motion detection is adjustable in setup.
- **Discrete Outputs 1–2**
  The discrete output annunciator indicates that the associated discrete output on the LYNX terminal's Controller PCB is on. The LYNX terminal only displays the status of outputs 1 and 2. The status of output 3, 4, and 5 is not available on the LYNX terminal's display. Output functions are programmed in setup.
- **Weighing Range R1 or R2**

  If the LYNX terminal is configured for two weighing ranges, the R1 annunciator will indicate that the scale is in the low range and R2 the high range.

LYNX Keypad

Each LYNX terminal is equipped with a 20-key keypad as shown here:

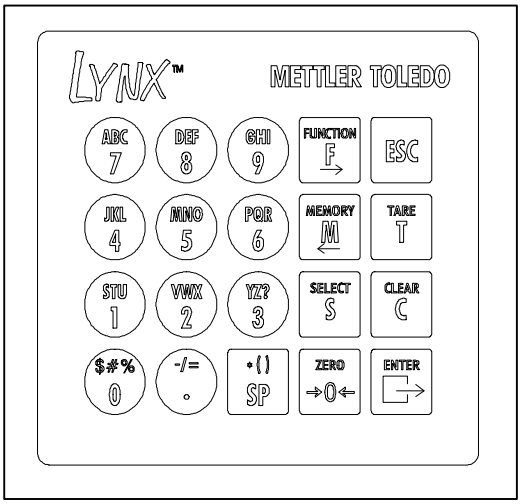


Figure 3-2 LYNX Keypad

The keypad consists of numeric keys 0 through 9, the decimal point, space key, and eight function keys. The numeric keys also contain the alphabet characters and special symbols.

NUMERIC Keys are used to input numbers and to enter alphabet characters and the symbols that appear on specific keys. (See Alphabetical and Special Character Entry later in this chapter.)

- DECIMAL POINT (.) inserts a decimal point as necessary. It is also used to enter the symbols "–", "/", and "=".
- SPACE (SP) inserts a space where necessary. It is also used to enter the symbols "*", "(", and ")".
- FUNCTION (F) accesses various functions depending on the LYNX terminal's setup configuration including:

  Dynamic Weighing Mode—If enabled, the dynamic weighing mode averages scale weight when excessive motion on the scale cannot be stabilized such as when weighing livestock.

  Switch Units—If enabled, switch units allows you to change the display unit of measure for scale weight.

  Recall Tare—If enabled and the terminal is in the net mode, recall tare allows the tare value to be recalled in the display.

  Recall Gross—If enabled and the terminal is in the net mode, recall gross allows the gross weight value to be recalled on the weight display.

  Accumulation Recall and Print—If enabled, accumulation recall and print lets you recall and print accumulated totals.

  ID/Tare View and Print—If enabled, ID/Tare recall and print lets you view and print a single stored tare record or reports showing multiple records.

  Enter Setup—If configured, you may use the FUNCTION and SELECT keys to enter setup and configure the program blocks in setup mode.

  Edit—When editing a text string, the FUNCTION key acts as a right arrow moving the cursor one position to the right with each keystroke.

- MEMORY (M) accesses various memory functions depending on the LYNX terminal's setup configuration including:

  Recall ID—If ID/Tare is enabled, recall ID lets you recall a stored ID record from memory.

  Store ID—If ID/Tare is enabled, store ID lets you store a weight transaction in memory.

Prompt List—Prompt lists permit data entry into a user-defined prompt list which was created through the Configure Memory program block in setup.

Setpoints—If accessed, this feature allows entry of the setpoint cutoff values.

Consecutive Number—This feature displays the current consecutive number. You can also reset the consecutive number.

Time—The time feature displays the clock and allows adjustment of the time.

Date—The date feature displays the date and allows adjustment of the date.

In some cases, you may be able to enter only numeric characters.

Edit—When editing a text string, the **MEMORY** key acts as a right arrow moving the cursor one position to the right with each keystroke.

- **SELECT** (S) scrolls through and displays items in option lists and acts as a special function key if assigned in the Application Environment program block.
- **ZERO** (→0←) zeroes the scale.
- **ESCAPE** (ESC) exits an operating mode.
- **TARE** (T) performs a pushbutton tare function if enabled in setup.
- **CLEAR** (C) clears a tare value and returns the scale to gross mode. The **CLEAR** key also functions as a backspace/delete when entering data from the keypad.
- **ENTER** acknowledges a prompt and accepts data entered from the keypad. It also initiates a demand print output.

Alphabetical and Special Character Entry

You can use the LYNX terminal's keypad to enter alphabetic characters as well as numbers. To enter an alphabet character:

1. Press the numeric key with the desired letter. The number is displayed.
2. Press **SELECT** one or more times until the desired letter appears.
3. Press the key that contains the next character you wish to enter, then press **SELECT** until the desired letter appears.
4. When you have finished entering all letters and numbers, press **ENTER**. The data is accepted when **ENTER** is pressed.

For example, to enter the name "TOM":

Key Press	Display Shows
	1
	S
	T
	T5
	TM
	TN
	TO
	TO5
	TOM
	Varies depending on situation

Editing Data

When a text string of characters is shown on the display, the **CLEAR**, **ESCAPE**, **FUNCTION** and **MEMORY** keys can be used to edit the character string.

CLEAR—deletes the last character at the right of the display. If **CLEAR** is pressed when a string is first displayed, the entire string is deleted.

ESCAPE—returns the original data to the display if it has been edited.

FUNCTION—acts as a right arrow moving the cursor across the display in the right direction.

MEMORY—acts as a left arrow moving the cursor across the display in the left direction.

The position at the far right of the display is the active edit position. From this position, you can insert a character and not delete the existing character in that position.

For example, to change the name "TOM" to “TIM”:

Key Press	Action	Display Shows
		TOM
MEMORY M ←	Moves edit position left	TO
CLEAR C	Deletes letter O	TM
FUNCTION F →	Moves edit position right	T
GHI 9	Inserts character	T9
SELECT S	Changes character	TG
SELECT S	Changes character	TH
SELECT S	Changes character	TI
FUNCTION F →	Moves edit position right	TIM
ENTER ↵		Varies depending on situation

Power-up Sequence

The LYNX terminal performs a series of self tests when it is turned on to confirm normal operation. The power-up sequence is as follows:

1. All segments of the display window are lit. This verifies operation of all segments.
2. The LYNX terminal performs internal power-up tests and displays the following messages as these tests are performed:
   METTLER TOLEDO **LYNX**
3. After a delay, the terminal displays the software part number.
4. Next, the terminal tests communication with the load cell. The terminal displays weight when successful communication is established. If the LYNX terminal is unable to establish communication, an error is displayed.
5. Finally, if enabled, the LYNX terminal power-up timer counts the minutes and seconds remaining before the unit advances to normal operating mode. Power-up timer configuration is discussed in the section entitled Application Environment Program Block.

The total power up sequence requires approximately 25 seconds. This delay is analogous to the time required to "boot" a personal computer.

Operator Functions

A LYNX terminal connected to a scale performs as part of the scale. All scale operations are performed from the terminal. This section discusses normal operating mode and these operator functions:

- Zero the scale
- Tare operations
- Print operations
- Automatic prompting operations
- MEMORY key operations
- FUNCTION key operations
- SELECT key operations

Normal Operating Mode

The LYNX terminal can display the current gross or net weight values. The annunciators indicate the status of the display and weighing mode (NET or GROSS). The following table illustrates the display conditions.

Normal Weight Display		
Condition	**Display Annunciators**	**Example**
GROSS or NET mode; Gross weight recalled	gross weight	2394 g
	gross mode	G
NET mode	net weight	2234 g
	net mode	NET
NET mode; Preset tare recalled	tare weight	161 g
	tare mode	PT
NET mode; Pushbutton tare recalled	tare weight	161 g
	tare mode	T
Net mode; Automatic tare recalled	tare weight	161 g
	tare mode	T

Zero the Scale

If Pushbutton Zero is enabled, you can press **ZERO** to establish a new zero center of reference for the scale when in gross mode. This is done as follows:

Press the ZERO key. One of the following situations occurs:

Condition	Lower Display Reads
Pushbutton zero disabled	OUT OF ZERO RANGE and returns to normal mode.
Pushbutton zero enabled Residual weight on scale less than pushbutton zero range*	Scale is zeroed.
Pushbutton zero enabled Residual weight on scale greater than pushbutton zero range*	OUT OF ZERO RANGE and returns to normal mode.
Pushbutton zero enabled Scale in net mode	ILLEGAL SCALE MODE and returns to normal mode.

* Pushbutton zero range is configured in setup.

Tare Operations

Tare operations are enabled or disabled in setup. The LYNX terminal supports three tare operations:

- Pushbutton Tare
- Preset (Keyboard) Tare
- Auto Tare

The following tare-related features are also supported:

- Auto Clear Tare
- Recall Tare
- Recall Gross
- Tare Interlock

Pushbutton Tare

Pushbutton tare compensates for weight (usually an unknown quantity such as an empty box or other container) on the weighing platform with a single keystroke and switches the terminal to net mode.

If Pushbutton Tare is Enabled:

1. Place a load to be tared on the scale platform and press TARE. The display reads 0.0 with the net annunciator illuminated.
2. Place the load to be weighed on the platform. The net weight of the load is displayed.
3. Clear tare by pressing CLEAR. The terminal returns to gross mode and displays the weight on the platform.

Example: Pushbutton Tare

The operator places an empty container on the scale and the display shows 12.3 lb with the Gross annunciator lit. The operator presses TARE. The display shows 0.0 lb with the NET annunciator lit. The operator then fills the container with 50 pounds of material. The terminal displays the net weight of the load in the container as 50.0 lb with the NET annunciator lit.

When the filled container is removed, the display shows the negative tare value as –12.3 lb with the NET annunciator lit. The operator presses CLEAR. The LYNX terminal returns to gross zero.

Preset (Keyboard) Tare

Preset tare, also called keyboard tare, compensates for a known tare weight on the scale. Preset tare is used when the net weight of the contents in a filled container must be determined and the tare weight is known.

If Preset (KB) Tare is Enabled:

1. Place the load on the platform. The display shows the gross weight of the load. Be sure you know the weight of the portion to be compensated for by preset tare.
2. Use the numeric keys to enter the known tare weight, then press ENTER. The net weight of the load is with an annunciator indicating NET.
3. Clear tare by pressing CLEAR. The terminal returns to gross mode and displays the gross weight on the platform.

Example: Preset Tare Enabled

A loaded truck (80,000 pounds) is driven onto a weigh station platform. The operator enters the known weight of the truck (17,500 pounds). The LYNX terminal displays the net weight of the truck's contents as 62,500 lb with the NET annunciator lit.

When the truck drives off the platform, the operator presses CLEAR to clear the tare value and return to gross zero.

Auto Tare

Auto tare automatically tares the indicator when a stable load on the platform exceeds a preset gross weight threshold value. A gross weight reset value is used to determine when the terminal will be "re-armed" to do another auto tare.

If enabled, the LYNX terminal checks the stability of the load before re-arming auto tare. You may want to disable motion check if the load will not become stable, as when rapidly weighing one item after another.

If Auto Tare is Enabled:

You do not have to press any key to perform tare, but you must press CLEAR to return to gross mode.

1. Place a load on the platform that exceeds the tare threshold value. When the scale is stable, the terminal automatically tares the scale to net zero.

2. Place the load to be weighed on the platform. The LYNX terminal displays the net weight with an annunciator indicating NET.
3. Clear tare and return to gross mode by pressing the CLEAR key.
4. When the weight is removed and the reset threshold is passed, the scale rearms for the next sequence.

Example: Auto Tare Enabled

The auto tare threshold value has been set to 100 pounds through the Application Environment program block. The operator places an empty container on the platform that is known to weigh more than 100 pounds. The LYNX terminal automatically tares the scale and displays 0 lb NET. The operator then fills the container and records the net weight of the load.

When the filled container is removed and the weight on the platform falls below the reset threshold value, the LYNX terminal rearms and is ready for the next container. If check motion is enabled, the LYNX terminal will not re-arm unless the weight on the scale settles below the reset threshold value.

Auto Clear Tare

Auto clear tare can be used with any or all of the tare options described. This feature automatically clears the tare and returns the terminal to gross mode when weight on the platform has exceeded then fallen below a preset gross weight threshold value.

The check motion parameter can be enabled to ensure the scale weight is stable before automatically clearing tare.

Recall Tare

The LYNX terminal allows you to recall and display the tare in net mode. This is useful if you need to review the tare weight during a weighing process.

Tare recall is accessed through the FUNCTION key. See the section entitled Function Key Operations for more information.

Recall Gross

The LYNX terminal allows you to recall and display the gross weight in net mode. This is useful if you need to see the gross weight but do not wish to clear the current tare value.

Gross weight recall is accessed through the FUNCTION key. See the section entitled Function Key Operations for more information on gross weight recall.

Tare Interlock

If tare interlock is enabled, tare may be cleared only at gross zero, and multiple tares are prohibited.

Print Operations

The LYNX terminal supports the following print operations:

- Demand Print
- Minimum Print
- Print Interlock
- Auto Print
- Net Sign Correction
- Continuous Output

Any of the print operations can be enabled or disabled in setup. The print output format and destination port are also determined in setup. Output can be directed through one or more local serial ports (COM1, COM2, or COM3).

Demand Print

If a demand mode connection is configured, demand printing is initiated when an operator presses the ENTER key in normal operating mode or through an external interface such as a discrete input port or an ASCII input command. If no conditions exist to inhibit printing, output will be sent to the connected printer and the terminal displays the message PRINTING.

If a demand mode connection is not configured, the terminal displays PRINT INHIBITED. If a demand print is requested while weight on the scale is unstable, the terminal waits until motion stops, then prints.

If no demand mode connection is selected but a host or continuous connection exists, the display reads PRINT REQUESTED and the respective connections reflect the request.

Minimum Print

The minimum print parameter prohibits data output if gross weight on the scale is below a threshold value configured in setup. If you press ENTER to initiate printing with scale weight below the threshold value, the terminal displays PRINT NOT READY on the display.

Print Interlock

Print interlock prevents multiple print requests for a single weighing transaction. Print threshold and reset values determine operation of print interlock. Additionally, a check motion before reset parameter can be enabled.

If print interlock is enabled and conditions of print interlock are not satisfied, the terminal displays PRINT NOT READY.

Auto Print

Auto print allows printing to occur without operator action. The terminal automatically initiates data output when gross weight on the scale settles above the print threshold value. Auto print is “re-armed” when the weight falls below the reset threshold value. A check motion before reset parameter can also be configured for auto print.

Continuous Output

Serial ports can be configured to output data continuously. In continuous mode, weight data is transmitted up to 20 times per second in a fixed format. A status bit in the fixed format changes state when a demand print request is received.

Host Mode

Serial ports can also be configured for connections to a host device such as a personal computer. In the host mode, weight data can only be requested from the host device; data is not transmitted without a request. A status bit in one of the host status bytes indicates a print request has been received.

Automatic Prompting Operations

Automatic prompting causes the LYNX terminal to automatically jump from the normal weighing mode to the first step in a prompt list. Prompt lists, described later in this chapter, facilitate specific data input from the operator or cause some specific action to take place, such as taring the scale or printing.

If automatic prompting is enabled, the LYNX terminal will jump to the prompt list whenever the weight exceeds a preset, auto prompt threshold value. It will then be “re-armed” for the next cycle when the weight drops below the auto prompt value. Whether or not the scale must settle to a no-motion state before jumping or re-arming is determined by setting a flag in the auto prompt setup program sub-block.

MEMORY Key Operations

The **MEMORY** key is used to perform the following operations:

- Store and recall temporary and permanent ID/Tare records
- Use a prompt list
- Assign consecutive numbers
- Assign setpoints
- Set LYNX terminal system time
- Set LYNX terminal system date

Memory operations are enabled or disabled in setup.

Store and Recall Temporary and Permanent ID/Tare Records

The LYNX can store up to 99 commonly used tare values in memory.

The LYNX terminal can store two types of tare records in memory: temporary and permanent tares. Temporary tare records are stored and recalled with the **MEMORY** key and are automatically cleared after recall. Temporary tare records are used for one transaction only.

Permanent tare records are also stored and recalled with the **MEMORY** key; however, permanent tare records can be used repeatedly as defined in setup.

Each tare record can be accessed with a one- or two-digit ID number or an alpha-numeric Record ID (up to 10 characters).

The following example illustrates temporary vs. permanent tare records.

A privately contracted truck comes onto a scale at a filling site. It will fill only one load for the contractor. Because this truck will be weighed in and out only once, the operator enters the truck's tare weight as a temporary record.

You may also be able to use the auto print feature depending on setup configuration.

The truck fills and comes back onto the scale to be weighed out. The operator recalls the previously stored temporary tare record, and the LYNX terminal prints a ticket and displays net weight. The temporary tare record is automatically cleared and cannot be recalled again.

If auto print is enabled in setup, the LYNX terminal prints the transaction then displays net weight.

However, if one or more trucks are filled and weighed repeatedly, the operator enters the tare weights as permanent records. Each time one of the filled trucks come onto the scale, the operator recalls its permanent ID/Tare record. The LYNX terminal prints a ticket and displays net weight. The permanent tare record can be recalled as many times as configured in setup.

The **Descript?** prompt appears only if enabled in setup.

The **FUNCTION** key lets you generate reports listing data pertaining to temporary and permanent ID/Tare records. You can also clear ID/Tare records. Refer to the following section entitled FUNCTION Key Operations for more information.

Tare and net weight printing operations are possible when recalling a stored tare value.

To store a temporary ID/Tare record:

1. In normal operating mode and with the container to be tared on the platform, press **MEMORY**, then press **SELECT** to display the **Store ID?** prompt. Press **ENTER**.
2. At the **ID?** prompt, enter an ID designation. If one or two digits are entered, the ID is stored as a numeric ID number. If more than two digits are entered, or if alphanumeric characters are entered, the ID is stored as a Record ID.

   The LYNX terminal automatically searches its memory to verify that the entered ID designation is not already used. If the record ID is not used, the LYNX terminal stores the tare value and returns to normal weighing mode. If the ID is used, the LYNX terminal responds **ID EXISTS!** and displays the **ID?** prompt so you can enter a different ID.
3. At the **Descript?** prompt, press **ENTER** then enter a description for this record. The LYNX terminal stores the record and returns to normal operating mode.

Recall a Temporary ID/Tare Record

Temporary tare values stored in the LYNX terminal's memory are recalled using the **MEMORY** key. When a stored ID is recalled, the net weight of the contents in the container is displayed.

To recall a temporary ID/Tare record:

1. In normal operating mode with the filled container on the platform, press **MEMORY**, then press **ENTER** at the **Recall ID?** prompt.

2. At the **ID?** prompt, enter the stored ID corresponding to the stored tare value for the container on the platform. The LYNX terminal automatically searches for the tare value according to the ID you entered. One of the following situations occurs:

   - If the description feature is enabled, the LYNX terminal displays the **Descript?** prompt for two seconds, then blanks, allowing you to enter a description. Enter a description (maximum 20 alphanumeric characters), or press **ENTER** at the blank screen to continue.
   - If the ID record is found and the description feature is disabled, the LYNX terminal recalls the tare value, returns to normal operating mode, and displays the net weight of the contents in the container.
   - If the ID is not found or invalid, the LYNX terminal responds **ID EMPTY!**, and returns to the **ID?** prompt.

Store a Permanent ID/Tare Record

Permanent ID/Tare records are stored in the same manner as temporary records using the **MEMORY** key. However, they may be password protected if this feature is enabled in setup.

To store a permanent ID/Tare record:

1. Press **MEMORY**, then press **SELECT** to display the **Perm Tare?** prompt. Press **ENTER**.

The **Pass?** prompt appears only if password protection is enabled in setup.

2. At the **Pass?** prompt, enter your password. If the password is valid, the LYNX terminal continues. If the password is invalid, the LYNX terminal responds with the message **INVALID PASSWORD** and returns to normal operating mode.
3. At the **Quick ID:** prompt, enter a two-digit ID for the tare record you are storing. You must enter two numeric digit. The display reads **Searching** while the LYNX terminal searches for an existing record with that ID. One of the following situations will occur:

Either the two-digit Quick ID or the Record ID can be used to recall permanent ID/Tare records.

If the ID does not already exist:

- At the **New ID?** prompt, select **Y** to enter a new record. Alternately, you can select **N** to return to the **Quick ID** prompt and enter a different ID.
- At the **Record ID** prompt, enter a longer, more descriptive ID for the record of up to 10 alphanumeric characters. It can be used to recall the record.
- At the **Descript?** prompt, enter a description of up to 20 alphanumeric characters for this record.
- At the **Tare** prompt, press **TARE** to enter the tare weight, or use the numeric keys to enter the tare value manually (if Manual Entry is enabled in setup).

- At the **Another?** prompt, select **Y** to enter another permanent tare record or **N** to return to normal operating mode.

If the ID already exists:

- At the **Delete?** prompt, select **Y** to clear the existing record or **N** to edit the record.

  If you select **Y**, the LYNX terminal automatically clears the record and continues to the **Another?** prompt.

  If you select **N**, at the **Edit?** prompt, select **Y** to enter new data for the record. As the LYNX terminal displays the existing data, use the alphanumeric keys to enter new data for Record ID, Description, and Tare as desired.

- At the **Another?** prompt, select **Y** to enter another permanent tare record, or select **N** to return to normal operating mode.

Responses to prompts can be entered manually using the keypad or through the LYNX terminal's serial port from a bar-code scanner or other ASCII device.

Tare and net weight printing operations are possible when recalling a stored tare value.

Recall a Permanent ID/Tare Record

Permanent tare values stored in the LYNX terminal's memory are recalled using the **MEMORY** key. When a stored ID is recalled, the net weight of the contents in the container is displayed.

To recall a permanent ID/Tare record:

1. In normal operating mode with the filled container on the platform, press **MEMORY**, then press **ENTER** at the **Recall ID?** prompt.
2. At the **ID?** prompt, enter the stored ID corresponding to the stored tare value for the container on the platform. The LYNX terminal automatically searches for the tare value according to the ID you entered. One of the following situations occurs:

   - If the ID record is found and the description feature is enabled, the LYNX terminal displays the **Descript?** prompt for two seconds, then blanks, allowing you to enter a description. Enter a description (maximum 20 alphanumeric characters), or press **ENTER** at the blank screen to continue.
   - If the ID record is found and the description feature is disabled, the LYNX terminal recalls the tare value, returns to normal operating mode, and displays the net weight of the contents in the container.
   - If the ID is not found or invalid, the LYNX terminal responds **ID EMPTY!** and returns to the **ID?** prompt.

If auto print is enabled in setup, the LYNX terminal prints the transaction then displays net weight.

Prompt List

The LYNX terminal's prompt list feature is a simple but powerful means of facilitating specific data input from the operator or to cause a specific action to take place. The prompt list may be up to 20 steps with each step containing a command that determines the action the LYNX terminal will take when the step in executed.

If there is a setpoint entry prompt in your prompt list, you can enter the dribble and preact values for the setpoint by pressing SELECT. Pressing ZERO will abort the setpoint entry prompt.

Data previously entered in response to a prompt can be retained or automatically cleared depending on how the prompt was configured during setup.

If a Feed or Discharge prompt is included in the prompt list, the ESC key can be pressed to terminate the output. Refer to Appendix 3 for a discussion on applying the LYNX terminal in filling systems.

The prompt list can be accessed automatically when a weight threshold is exceed, if auto prompting is enabled, by assigning the prompt list to the action of the SELECT key or by using the MEMORY key as follows:

1. In the normal weighing mode, press the MEMORY key then press SELECT to display **Prompt List?** Press ENTER.
2. Respond to each prompt, if appropriate, as indicated by the prompt. Some prompts, such as an automatic tare or print command, do not require a response. If manual data entry is required, you must press ENTER to terminate the input.
3. After the final prompt, the LYNX terminal will return to the normal weighing mode unless "loop mode" was selected in setup. Loop mode will cause the LYNX terminal to start over again at the first prompt. You may press ESC at any time in the prompt list sequence to terminate prompt list execution.

Assign Setpoints

The LYNX terminal can control up to five single-speed setpoints or a combination of single-speed and two-speed setpoints. These outputs are available on the PAR2 connector of the Controller PCB and in the continuous output of the LYNX terminal.

- **Single-speed setpoints** consist of a coincidence setpoint value and a preact value (if enabled in setup). The preact value compensates for material in suspension that will still fall onto the scale after the setpoint is turned off. The setpoint actually turns off at the programmed setpoint minus the preact value.
- **Two-speed setpoints** consist of a setpoint value, a dribble value, and a preact value. Tolerance is also programmable. With two-speed setpoints, the dribble value can be programmed to define an amount of material to be fed at a slower rate. The slower delivery rate begins when weight on the scale equals the setpoint value minus the dribble value.

The LYNX terminal prompts only for the selected setpoint fields during setpoint programming. If preact is not enabled in setup, LYNX will not prompt for preact.

The LYNX terminal prompts for setpoint and tolerance values if these features are enabled in setup. You can also select in setup which weight will be used with the setpoints (gross, net, or displayed).

METTLER TOLEDO recommends disabling unit switching to avoid confusion when using setpoints.

To enter setpoint values:

1. Press MEMORY, then press SELECT until the prompt **Setpoints?** is displayed. Then press ENTER to access setpoints.
2. If password protection is enabled in setup, at the **Pass?** prompt, enter a valid password. (If you enter an invalid password, the LYNX terminal responds **INVALID PASSWORD** and returns to normal operating mode.)
3. At the **Setpt#? 1** prompt, press ENTER to access setpoint 1, or press SELECT to access another setpoint, followed by ENTER.

If password protection is not enabled, continue to step 3.

If the selected setpoint is a single-speed setpoint:

- At the **Setpoint?** prompt, press SELECT to accept the current setpoint value and continue. Alternately, you can press ENTER if you wish to view

or change the actual setpoint value, then use the numeric keys to enter a new setpoint value.

- At the **Preact?** prompt, press **SELECT** to accept the current preact value and continue. Or, you can press **ENTER** to access and view or change the preact value, then use the numeric keys to enter a new preact value.

  When the preact value is set, the LYNX terminal returns to the **Setpt#?** prompt.

- Press **ESCAPE** to return to normal operating mode, or press **SELECT** to access another setpoint.

LYNX does not display the Preact prompt if the feature is not enabled in setup.

If the selected setpoint is a two-speed setpoint:

- At the **Setpoint?** prompt, press **SELECT** to accept the current setpoint value. Or, press **ENTER** to access and view or change the actual setpoint value, then use the numeric keys to enter a new setpoint value.

LYNX displays either the Zero Tol? or the Wt Tol? prompt depending on how the tolerance feature is configured in setup.

- At the **Dribble?** prompt, press **SELECT** to accept the current dribble value. Or, press **ENTER** to access and view or change the dribble value, then use the numeric keys to enter a new dribble value.

- At the **Preact?** prompt, press **SELECT** to accept the current preact value. Or, press **ENTER** to access and view or change the preact value, then use the numeric keys to enter a new preact value.

  At the **Zero Tol?,** or **Wt Tol?** prompt, press **SELECT** to accept the current tolerance value. Or, press **ENTER** to access and view or and change the tolerance value, then use the numeric keys to enter a new value.

  When the tolerance value is set, the LYNX terminal returns to the **Setpt#?** prompt.

- Press **ESCAPE** to return to normal operating mode or press **SELECT** to access another setpoint.

If the number of 2-speed setpoints is 1, the "Use Setpoint 2" option is configured as Yes, and the selected setpoint is Setpoint #2:

- At the **Setpoint?** prompt, press **SELECT** to accept the current setpoint value. Or, press **ENTER** to view or change the actual setpoint value> Then use the numeric keys to enter a new setpoint value.

- At the **Preact?** prompt, press **SELECT** to accept the current preact value. Or, press **ENTER** to access and view or change the preact value. Then use the numeric keys to enter a new preact value.

  At the **Wt Tol?** prompt, press **SELECT** to accept the current tolerance value. Or, press **ENTER** to access and view or change the tolerance value. Use the numeric keys to enter a new value.

  When the tolerance value is set, the LYNX terminal returns to the **Setpt#?** prompt.

- Press ESCAPE to return to normal operating mode.

Reset Consecutive Numbering

The LYNX terminal maintains a consecutive number (CN) and can assign a unique eight-digit number to each transaction. The CN automatically increments by one upon print initiation through a serial port.

To view the current CN:

1. Press the MEMORY key.
2. Press SELECT to display the CONSEC #? prompt, then press ENTER. The current CN is displayed as CN XX.

To reset the CN:

- With the current CN displayed (steps 1 and 2 above), press ENTER.
- At the Reset CN? prompt, press SELECT to chose Y, then press ENTER.

  If Y, confirm your decision at the Sure? prompt by selecting Yes again. The consecutive number is returned to the reset value configured in setup.

Consecutive numbering can be reset/preset manually only if the Enable Reset/Enable Preset features are configured as Yes in setup.

To preset the CN manually using the MEMORY key:

- With the current CN displayed (steps 1 and 2 above), press ENTER.
- At the Reset CN? prompt, press ENTER.
- At the Enter CN? prompt, select Y to set the consecutive number manually, or select N if you do not wish to preset the consecutive number at this time.

  If Y, enter a preset value for the consecutive number using the numeric keys. This number will be used as the last consecutive number printed and will increment on the first print.

Set Time

The LYNX terminal's internal battery-backed time can be viewed or set using the MEMORY key. Configuration of the time format is done in setup mode. Chapter 3 provides a complete list of available time formats. You can also disable the time format in the program block.

To view or reset the time:

1. Press MEMORY, then press SELECT until the time is displayed.
2. Press ESCAPE to accept the current time and exit. Or, press ENTER to set the clock. If you are setting the clock:
   - At the Hour? prompt, enter the correct hour of day using according to the selected time format. Press ENTER.
   - At the Minutes? prompt, enter the correct minutes, then press ENTER.
   - If the selected format supports seconds, enter the correct value at the Seconds? prompt. Press ENTER.

- If a 12-hour format is selected, press SELECT at the Am/Pm? prompt followed by ENTER when the desired designation is displayed.

Set Date

The LYNX terminal has a battery-backed date function. Configuration of the date format is done in setup mode. Chapter 3 gives a complete list of available date formats. You can also disable the date function through the same program block.

To view or reset the current date:

1. Press MEMORY, then press SELECT until the date is displayed.
2. Press ESCAPE to accept the current date and exit. Or, press ENTER to set the date. If you are setting the date, complete the date fields as prompted. You must press ENTER after each field. The order of prompting is determined by the selected date format.
3. Press ENTER after the last date prompt to exit.

FUNCTION Key Operations

The LYNX terminal supports these FUNCTION key operations:

- Dynamic Weigh mode
- Unit switching
- Tare weight recall
- Gross weight recall
- Accumulation total recall, print, and clear
- ID Tare functions
- Setup access

Dynamic Weigh Mode

The Dynamic Weigh mode, if enabled, averages weight readings on the scale for a predetermined amount of time, then displays the scale weight as an average. This weighing mode is useful for applications such as weighing livestock and other unstable loads. Automatic print is also available at the end of the weighing cycle.

To weigh unstable loads in dynamic weighing mode:

1. Place the unstable load on the scale. Press the FUNCTION key.
2. At the Dynamic? prompt, press ENTER. The display reads -Dynamic- while the LYNX terminal averages the weight of the load. When the load has been weighed and averaged for the predetermined time period, the LYNX terminal displays the average weight (with an asterisk indicating average). If enabled, the results print automatically at the end of the weighing cycle.

   The LYNX terminal returns to normal operation at the end of the weighing cycle.

Unit Switching

Unit switching allows you to change between main and secondary units of measure.

To switch units:

1. Press **FUNCTION** then press **ENTER** at the **Sw Units?** prompt. The LYNX terminal automatically switches to the alternate selection and displays the current unit of measure.

You must enable unit switching in setup to use the feature in normal operating mode. If unit switching is disabled, the LYNX terminal does not display the unit switching prompt.

Tare Recall

Recall tare allows the current tare value to be displayed. **You must be in net mode.**

To recall tare:

1. Press **FUNCTION** then press **SELECT** until the **Rcl Tare?** prompt is displayed.
2. Press **ENTER**. The LYNX terminal displays the recalled tare value.
3. Press **ESCAPE** to return the display to net weight.

The recalled tare value is a "snapshot" of the actual weight. It is not an active weight.

Gross Recall

Recall gross allows you to view a snap shot of the current gross weight in situations in which it is undesirable to clear the tare value. You must be in net mode.

To recall gross:

1. Press **FUNCTION** then press **SELECT** until the **Rcl Gross**? prompt is displayed.
2. Press **ENTER**. The LYNX terminal displays the recalled gross weight value.
3. Press **ESCAPE** to return the display to net weight.

The recalled gross value is a "snapshot" of the actual weight. It is not an active weight.

Accumulation Totals (Recall, Print, Clear)

The LYNX terminal's total and subtotal accumulators are accessed using the **FUNCTION** key. Accumulated totals can be viewed, printed, and/or cleared.

To recall accumulator totals:

1. Press **FUNCTION**, then press **SELECT** to display the **Accum?** prompt. Press **ENTER**.
2. At the **Rcl Totals** prompt, press **ENTER**. The LYNX terminal automatically displays the message **Total** for two seconds, then displays the accumulation in the total register. Press **ENTER** to continue.

You must enable accumulation in setup to use the feature in normal operating mode. If accumulation is disabled, the LYNX terminal does not display the accumulation prompt.

After the total accumulation is displayed, the LYNX terminal displays the message **Subtotal** for two seconds then displays the accumulation in the subtotal register. Press **ENTER** to continue.

After the subtotal accumulation is displayed, the LYNX terminal displays the message **Tran Count** for two seconds then displays the last consecutive number printed.

3. Press **ENTER** to continue.

To print accumulated totals:

Note: If more than one communications port is configured for demand mode output, the operator will be prompted for which port to use.

1. Press **FUNCTION**, then press **SELECT** to display the **Accum?** prompt. Press **ENTER**.
2. At the **Rcl Totals** prompt, press **SELECT** to display the **Prt Tot?** prompt, then select **Y** to print the report. Alternately, you can select **N** to skip the print and continue. The LYNX terminal transmits the accumulation report (as formatted in setup) through all demand serial ports. The default format prints as follows:

TIME 09:37am	DATE Sep 16 1995
TRANSACTIONS	61
SUBTOTAL	148592 g
TOTAL	148592 g

To clear accumulated totals:

1. Press **FUNCTION**, then press **SELECT** to display the **Accum?** prompt. Press **ENTER**.
2. At the **Rcl Totals** prompt, press **SELECT** twice to display the **Clr Tot?** prompt, then select **Y** to clear the total and subtotal registers. Press **ENTER** if you do not wish to clear **both** registers.

   You cannot clear only the totals register and keep the subtotal register accumulation.

   If **Y**, and if the password feature is enabled, the LYNX terminal displays the **Pass?** prompt.

   - Enter the correct password as configured in setup.
   - At the **Sure?** prompt, select **Y** to clear the totals and return to normal operating mode.

   If **N**, LYNX terminal continues to the **Clr Sub?** prompt.

3. At the **Clr Sub?** prompt, select **Y** to clear the subtotal register only, or press **ENTER** to clear the register.

   If you select **Y** and the password feature is enabled, the LYNX terminal displays the **Pass?** prompt.

   - Enter the correct password as configured in setup.
   - At the **Sure?** prompt, select **Y** to clear the totals and return to normal operating mode. Or, press **ENTER** to accept the **N** response and return to normal operating mode without clearing the accumulator.

ID/Tare

The ID/Tare function is used to manage the temporary and permanent tare records. You can:

- View and clear a single ID/Tare record.
- Print a report detailing temporary and permanent tare registers.
- Print a report of open temporary tare registers.
- Clear totals and number of transactions in the permanent tare register.

For more information on entering permanent and temporary ID/Tare records, see the section entitled MEMORY Key Operations.

To view and clear a single ID/Tare record:

1. Press **FUNCTION**, then press **SELECT** to display the **ID/Tare?** prompt. Press **ENTER**.
2. At the **Single ID** prompt, press **ENTER** to recall a record.
3. At the **ID?** prompt, enter the two-digit ID or the alphanumeric Record ID. The LYNX terminal displays the message **Searching** as it scans its memory for the record. If the record is found, the LYNX terminal displays the record description. If it is not found, the LYNX terminal displays the **ID?** prompt again so you can reenter the correct ID or Record ID.
4. Press **ENTER** when the correct record description is displayed. The LYNX terminal displays the message **Tare** for two seconds, then displays the tare value for that record.
5. Press **ENTER** after you have viewed the tare value. The LYNX terminal next displays the message **Accum** for two seconds, then displays the actual accumulated total for the record.

   Only permanent tare records have an accumulation value.
6. Press **ENTER** after you have viewed the accumulated total. The LYNX terminal next displays the message **Trans**, then displays the number of transactions that have been performed using this tare record.
7. Press **ENTER** to continue.
8. At the **Clear ID?** prompt, select **Y** or **N** to clear the current record.
   - If **Y** and if Clear ID is password protected, at the **Pass?** prompt, enter your password. If the password is valid, at the **Sure?** prompt, select **Y** to clear the record and return to normal operating mode. Or, press **ENTER** to accept the **N** response and return to normal operating mode without clearing the record.

     The print/clear operation for All records also clears accumulation and consecutive numbering data for permanent records.

     The LYNX terminal clears the ID/Tare record and returns to normal operating mode. If the password is invalid, the LYNX terminal returns to the **Clear ID?** prompt.
   - If **N**, the LYNX terminal returns to normal operating mode without clearing the ID/Tare record.

To print and clear all ID/Tare records:

1. Press FUNCTION, then press SELECT to display the **ID/Tare?** prompt. Press ENTER.
2. Press SELECT to display the **All ID's** prompt, then press ENTER.
3. At the **Prt All?** prompt, select Y to print a report detailing all ID/Tare records including open temporary and permanent records. The LYNX terminal displays the message **Printing** as it generates and prints the report. Alternately, you can select **N** if you wish to continue without printing a report.
4. At the **Clr All?** prompt, select Y to clear all open temporary and permanent ID/Tare records.

   Note: If more than one communications port is configured for demand mode output, the operator will be prompted for which port to use.

   - At the **Pass?** prompt, enter your password. If the password is valid, at the **Sure?** prompt, select Y to clear the records and return to normal operating mode. Alternately, you can press ENTER to accept the **N** response and return to normal operating mode without clearing the records.

     If the password is invalid, the LYNX terminal returns to the **Clear All?** prompt.

   - If you select **N** at the **Clr All?** prompt, the LYNX terminal returns to normal operating mode without clearing the ID/Tare records.

To print and clear all open, temporary ID/Tare records:

1. Press FUNCTION, then press SELECT to display the **ID/Tare?** prompt. Press ENTER.
2. Press SELECT to display the **Open ID's** prompt, then press ENTER.
3. At the **Prt Open?** prompt, select Y to print a report detailing all open temporary ID/Tare records. The LYNX terminal displays the message **Printing** as it generates and prints the report. Or, select **N** if you wish to continue without printing a report.
4. At the **Clr Open?** prompt, select Y to clear all open temporary ID/Tare records.

   - At the **Pass?** prompt, enter your password. If the password is valid, at the **Sure?** prompt, select Y to clear the records and return to normal operating mode. Or, press ENTER to accept the **N** response and return to normal operating mode without clearing the records.

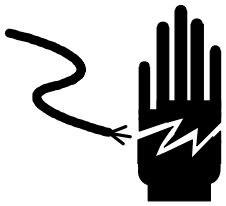
     If the password is invalid, the LYNX terminal returns to the **Clear Open?** prompt.

   - If you select **N** at the **Clr Open?** prompt, the LYNX terminal returns to normal operating mode without clearing the ID/Tare records.

Enter Setup

You can access the LYNX terminal's setup programming blocks only if the terminal is used in non legal-for-trade applications and is configured to allow

access to setup parameters. Refer to Chapter 2 for detailed information on programming and setup parameters.



WARNING

ONLY PERMIT QUALIFIED PERSONNEL TO SERVICE THIS EQUIPMENT. EXERCISE CARE WHEN MAKING CHECKS, TESTS AND ADJUSTMENTS THAT MUST BE MADE WITH POWER ON. FAILING TO OBSERVE THESE PRECAUTIONS CAN RESULT IN BODILY HARM AND/OR PROPERTY DAMAGE.

To enter setup, press **FUNCTION**, then press **SELECT** to display the **Setup?** prompt. Press **ENTER**.

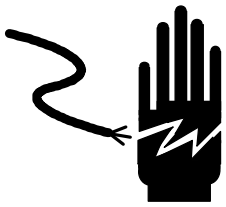
SELECT Key Operations

If assigned in setup, the **SELECT** key may be used to perform one frequently used function. The following is a list of the functions that may be assigned to the **SELECT** key:

The **SELECT** key will only perform its reassigned function when appropriate. For example, you cannot toggle between Net and Gross if the scale does not have a current tare.

- Toggle between Net and Gross display
- Toggle between Net and Tare display
- Toggle between Net, Gross and Tare display
- Toggle between Primary and Secondary units
- Process the prompt list
- Store an ID record
- Recall an ID record
- Prompt for entry of Setpoint Number 1
- Prompt for entry of Setpoint Number 2
- Start dynamic weighing cycle
- Recall Total Accumulator to display
- Print the Accumulation Report

4 Service and Maintenance



⚠ WARNING

ONLY PERMIT QUALIFIED PERSONNEL TO SERVICE THIS EQUIPMENT. EXERCISE CARE WHEN MAKING CHECKS, TESTS AND ADJUSTMENTS THAT MUST BE MADE WITH POWER ON. FAILING TO OBSERVE THESE PRECAUTIONS CAN RESULT IN BODILY HARM AND/OR PROPERTY DAMAGE.

Tools and Supplies

You should keep the following items on hand for service and maintenance of the LYNX terminal. A full set of common hand tools may also be required.

- Volt-Ohm meter
- Single DigiTOL load cell simulator (PN 0917-0178) if a DigiTOL scale is used
- Analog load cell simulator PN 8245100A (variable) or PN 10086500A (10 step) if an analog load cell scale is used
- Soft, lint-free cleaning cloth
- Anti-static bags (5 in. x 8 in.) for PCBs (PN 140063 00A)
- Anti-static wrist strap and mat
- Screw driver (PN 144761 00A)
- Flat and Phillips head screw drivers
- Allen wrench (2 mm) (PN 144118 00A)

Cleaning and Regular Maintenance

You may wipe the keyboard and cover with a clean, soft cloth that has been dampened with a mild glass cleaner. Do not use any type of industrial solvent such as toluene or isopropanol (IPA) on the keyboard/display assembly of the general purpose or the panel mount unit. Solvents may damage the keyboard/display and/or cover finish. Do not spray cleaner directly onto the unit.

Regular maintenance inspections by a qualified service technician are recommended.

Troubleshooting

If problems occur, do not attempt to repair the scale or terminal before you have determined the source of the problem. Begin by performing the diagnostic tests described in Chapter 3. If the problem persists, you can use the error codes table below to help identify the problem.

Error Codes and Actions

The following table lists the LYNX terminal's error messages with possible cause, and remedy.

Error Message	Description	Probable Cause	Remedy
BRAM BAD	Battery backed RAM error.	Setup parameters in Battery Back RAM have been corrupted. Most likely causes are too long of storage for LYNX terminal, power has been removed from LYNX terminal memory too long, battery failure, or hardware failure.	Respond Y(es) to reset to factory settings. Reprogram setup parameters. If problem persists, you may have to replace battery, power supply, or controller card.
CALIBRATE ERROR	Calibration error.	The most likely cause is an improper setup or calibration sequence. Another possible cause is a bad load cell.	Check wiring. Check with simulator. Check load cell and recalibrate. Verify calibration setup parameters.

Error Message	Description	Probable Cause	Remedy
CLEAR TARE AT ZERO	According to the scale setup parameters, the scale must be at gross zero in order to clear tare.	If you select Tare Interlock, the scale must be at gross 0 in order to clear tare.	Check your local Legal For Trade requirements. If you don't want this feature, turn off the Tare Interlock selection.
DLC ERR NO COMM	No communication or an intermittent communication failure to the DigiTOL load cell.	Bad DigiTOL base, Interconnect cable, or serial port.	Check voltages. Check with simulator. Verify serial output port. Check cable/cell.
DLC ERROR 2 DLC ERROR 3 DLC ERROR 5 DLC ERROR 6 DLC ERROR 7	The LYNX terminal has detected a bad protocol exchange with a DigiTOL load cell.	Noise being generated on cable between LYNX terminal and DigiTOL load cell.	Check cabling, grounding, and connections at LYNX terminal and at DigiTOL base.
DLC INVALID CHNL	DigiTOL load cell invalid channel.	Communications port assigned to the DigiTOL load cell is invalid.	Check COM port selection in setup. If setup appears correct, reset LYNX terminal to factory setup. Re-program the setup parameters.
DLC PARITY ERROR	Parity error has been detected in communications between LYNX terminal and DigiTOL load cell.	Possible bad load cell, incorrect wiring, or electrical interference.	Check DigiTOL base, wiring, grounding, and power source.
EEPROM BAD	EEPROM Checksum Error. The scale calibration parameters stored on the EEPROM have been corrupted.	Hardware failure.	Press **ENTER** to accept the reset default Y response. You must recalibrate LYNX terminal scale.
ILLEGAL SCALE MODE	Zeroing scale in net mode.	User attempted to zero the scale in net mode.	Clear tare to put scale in gross mode before zeroing scale.
INCRM CHAIN TARE	A decreasing chain tare was attempted in a market where only incremental chain taring is permitted.	Chain taring that causes a decrease in the tare weight is not permitted in some markets in legal-for-trade applications. An incremental chain tare is a new tare on top of an already existing tare value where the new tare value is greater than the old tare value.	Check the market setting in setup. Check the "tare interlock" setting in setup. Check the legal-for-trade jumper on the controller board. Verify that these are set properly.

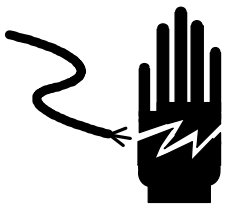
Error Message	Description	Probable Cause	Remedy
INVALID # LOAD CELLS	The LYNX terminal has been configured with an illegal number of load cells in a DJ-Box scale.	Improper Setup.	Check number of load cells configured for both scales. Correct the setup.
INVALID SCALE TYPE	Scale type definition is missing.	No scale type entered in Scale Interface menu.	Go to the “Scale Interface” setup menu and properly set the scale type.
KEY TARE INHIBITED	Keyboard tare disabled.	Keyboard Tare is disabled in the “Application Envn,Tare Operation” setup menu.	Change setup parameters to enable this feature.
MEM! FULL	The transaction memory buffer is full.	A host computer is not emptying the buffer as quickly as it is being filled.	Reconfigure the buffer full behavior in the Memory program block to “none” or fix the host computer.
NO CHAIN TARE	User attempted to take a second or “chain” tare after a tare was already taken.	When the tare interlock is selected in setup, chain taring is illegal in certain markets.	Check the local “legal for trade” requirements. Check the market selection and tare interlock settings in setup. The system will continue to operate properly but will not allow the chain tare.
NO SECOND UNITS	Secondary units not specified.	No secondary units selected in “Application Envn, Alt Weight Units” mode setup.	Change setup to enable the feature.
NO SERIAL CONNECTION	There is no demand print connection configured in setup.	No demand print entered in the “Config Serial, Configure Port” menu.	Change setup parameters.
NOT PRIMARY	ID/Tare not allowed.	Displaying secondary weight units.	Use the Select key to return to primary weight units.
OUT OF ZERO RANGE	Operator has attempted to zero the scale outside of the legal zeroing range.	The zeroing limits are set up in the “Application Envn, Zero Operation” menu	Change zeroing range in setup, if necessary.
OVER RANGE	The weight on the scale exceeds the calibrated capacity of the scale by more than 5 divisions.	There is too much weight on the scale based on calibration parameters.	Reduce the weight on the scale.

Error Message	Description	Probable Cause	Remedy
PB TARE INHIBITED	Pushbutton tare disabled.	Pushbutton Tare is disabled in the "Application Envn, Tare Operation" setup menu.	Change setup to enable this feature.
PRINT NOT READY	Scale is in motion while attempting to print.	None.	None.
PRINT REQUESTED	The operator has requested a Demand Print through the Control Panel.	None.	None.
PRINTING	A print operation is in progress.	None.	None.
SCALE IN MOTION	Scale in motion. This is a normal occurrence and not necessarily an error.	Motion on the scale during taring or zeroing the scale.	Try mechanical methods to stabilize the scale base first. Then, try changing the filtering to a stiffer setting in setup. Then, try changing the motion stability settings to make it less sensitive.
SHIFT ADJUST ERROR	The shift adjustment factors could not be calculated.	The weight placements during the shift adjust procedure was incorrect.	Carefully re-do the shift adjustment, perhaps, with bigger weights.
TARE OVER CAPACITY	Tare exceeds the capacity of the scale.	The tare value cannot exceed the capacity of the scale.	Make sure that the tare value is less than the capacity of the scale.
TARE TOO SMALL	Pushbutton tare value is less than one division.	Weight on scale must be at least one division when taking Pushbutton tare.	Make sure scale has at least one division of weight before taking pushbutton tare.
TARE UNDER ZERO	Attempted to take tare when scale is under zero and has an invalid weight.	Cannot take tare when scale is under zero.	Make sure scale has valid weight before taking tare.
TEMPLATE ERROR	Template error.	Error detected in template configuration.	Check template configuration. Correct it as necessary. If problem persists, use the Save/Load feature to save the current template contents then reset template to factory, and use Save/Load to reload the template.

Error Message	Description	Probable Cause	Remedy
TOO SMALL INCREMENT	Increment size is too small.	The scale increment size is too small so that you are asking for more resolution than the scale base is capable of supporting.	Choose a larger increment size parameter in setup and re-calibrate the scale.
UNDER ZERO	The scale gross weight has gone more than “n” divisions below the current zero. The default “n” is 5, but it can be adjusted in setup.	The zero value for the scale could have been reset by hitting the zero button. There could be a connection problem to the base, particularly, with an analog base.	Take all weight off the scale base and reset the zero value. Zero settings in setup determine the range of how far from the calibrated zero that you can set a new zero value. If your weighing process uses below zero weight values, you can disable the under zero by setting the zero blanking value to 99 divisions. Check the analog base wiring.
WRONG TARE INCREMENT	Keyboard Tare is not entered in a rounded value to the nearest increment.	In certain markets, the keyboard tare value must be entered in as a value rounded to the nearest increment.	Make sure the keyboard tare value is rounded to the nearest increment.
ZERO NOT CAPTURED	Tare attempted before power up zero value was captured.	Tare attempted before power up zero value was captured.	Wait a few seconds after power up before attempting a tare.

Testing Operational Voltages

To test voltages on the PCB, you must first open the LYNX terminal and access the Controller PCB.



⚠ WARNING

ONLY PERMIT QUALIFIED PERSONNEL TO SERVICE THIS EQUIPMENT. EXERCISE CARE WHEN MAKING CHECKS, TESTS AND ADJUSTMENTS THAT MUST BE MADE WITH POWER ON. FAILING TO OBSERVE THESE PRECAUTIONS CAN RESULT IN BODILY HARM.

To open the desk/wall and harsh environment versions of the LYNX terminal:

1. **Remove power!**
2. Insert the tip of a flat head screw driver into one of the two slots located at the bottom of the enclosure.
3. Push gently until the spring clip is released.
4. Repeat step 2 on the second slot.
5. Gently lift the front panel away. The front panel is connected by two cables to the unit. Let the front panel hinge on these two cables while you test voltages.
6. Reapply power.

To open the panel mount version of the LYNX terminal:

1. **Remove power!**
2. Remove the three Phillips head screws from the rear cover plate.
3. Remove the two Phillips head screws from the Option cover plate.
4. Gently slide the chassis from the enclosure until you can easily access the voltage test points. Be sure not to pull the battery cable or the transformer harness from the connectors at the rear of the assembly.
5. Reapply power.

Input Voltage Test

1. Unplug the transformer harness from J10 on the Controller PCB.
2. Using the Volt-Ohm meter, check the AC voltage between the two pins. Input voltage should be 28 VAC ± 8 Volts.

Regulated DC Voltage Test

The table below indicates the points to test the regulated DC voltages. Figure 5-1 illustrates the test points.

Regulated DC Voltage Test Points		
Voltage	**Measuring Point**	**Measurement**
19 VDC	Between chassis ground and the positive side D11	Between ± 2.0 VDC
8 VDC or 12 VDC	Between chassis ground and the positive side D13	Between ± 2.0 VDC
5 VDC	Between chassis ground and the positive side D10	Between ± .25 VDC
+15 VDC	Between chassis ground and U25, pin 1	Between ± .25 VDC

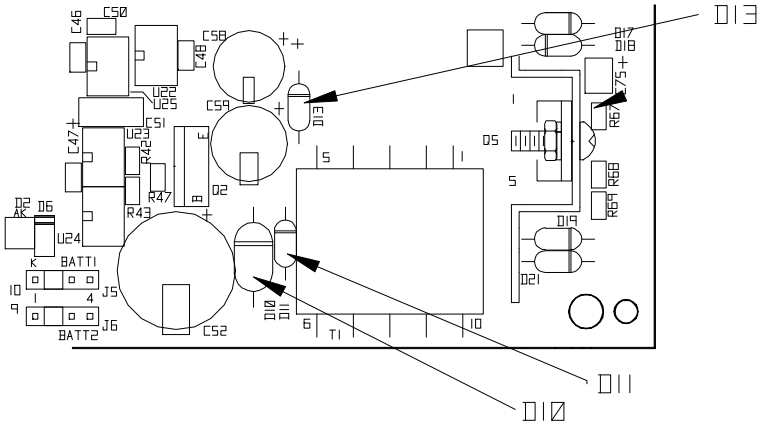


Figure 4-1 Regulated Voltages (on Controller PCB)

The 19 VDC supply provides voltage to the current loop. It is also provides voltage for analog excitation and the DigiTOL load cell.

The 8 VDC or 12 VDC supply provides voltage to the I/O port.

Early PCB assemblies which used bare PCB P/N (*)14479400A provided 8 VDC output. Later PCB assemblies based on bare PCB P/N (*)15153600A provide 12 VDC output. The bare PCB P/N is found on the solder side of the PCB assembly.

The 5 VDC supply provides voltage for all logic control points.

The ± 15 VDC supply provides voltage to the analog load cell. This voltage can also be measured between J1, pin 1 and J1, pin 7.

Battery Voltage Test

Battery voltage is tested at the battery connector (Batt 1 or Batt 2) on the Controller PCB.

Use the Volt-Ohm meter to measure voltage between Pin 1 and Pin 4. This measurement should be approximately 4.5 VDC.

If setup parameters are changing uncontrollably or if programming is lost, check the battery voltage. Replace the battery assembly if the measured voltage is below 3.75 VDC.

Display Voltage Test

The table below indicates the points on J4 of the Controller PCB where display voltage should be tested. Figure 4-2 illustrates the test points.

Display Voltage Test Points	
Test Point	**Voltage Measurement**
Between pin 1 and pin3 of J4	5 VDC
Between pin 1 and pin 8 of J4	5 VDC

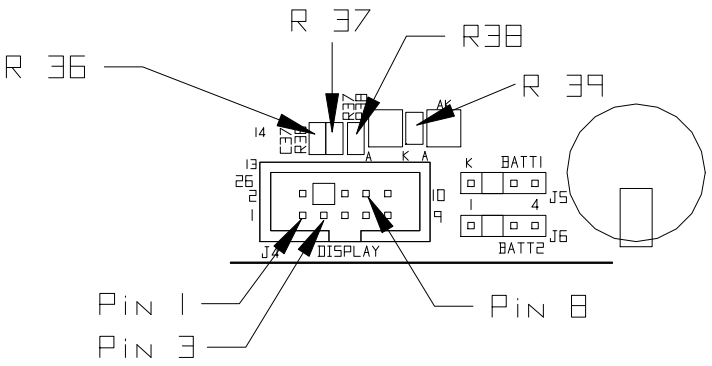

Figure 4-2 Display Voltage Test Points

You can also measure 5 VDC across R36, R37, R38, and R39.

If the display is not functioning and any of these voltages are not present, replace the Controller PCB.

Testing With Simulators

The quickest way to identify a problem with the LYNX terminal load cell(s) or scale base is to test with a load cell simulator. Both analog and DigiTOL simulators are available.

Analog

The following simulator test should be used with a 10-step analog simulator (PN 100865 00A) or an analog variable simulator (PN 082451 020).

1. With power removed, wire the analog simulator to the analog load cell on the Controller PCB.
2. If you are connecting a 10-step simulator, install a jumper between + Excitation and + Sense. Also install a jumper between – Excitation and – Sense.
3. Apply power and monitor the weight display. If the LYNX terminal operates normally (no weight drift, good linearity), the problem probably lies in the load cell (s) or scale base.

You may have to calibrate the LYNX terminal with the simulator connected to obtain a good weight display reading.

DigiTOL

The following simulator test should be used with a DigiTOL load cell simulator (PN 134460 00A). Use the CBL cable kit (PN 134460) with this simulator.

1. With power removed, plug the Dual 8 connector or harness (PN A133040 00A provided with the 134460 CBL kit) into the XX38 port of the simulator.
2. Plug the 9-pin Sub E connector of cable 130115 00A (provided with the 134460 CBL kit) into the 9-pin connector of the harness.
3. Wire the open end of cable 130115 00A to COM3 as described in Chapter 2 of this manual.
4. Set the selector switch on the simulator to read "7".
5. Apply power. After the LYNX terminal goes through the power-up sequence, the "Power" and "Pass" lights on the simulator should be lit. The LYNX terminal may show a blank display or an error code.
6. Step the simulator selector switch down to "1" and start calibrating, using "1" as zero and "6" as span. When calibration is complete, the LYNX terminal should respond exactly as if a scale were connected.
7. Test all LYNX terminal functions with the simulator. If problems that existed before connecting the simulator do not exist with the simulator, the problem probably lies in the scale base.

Any calibration errors during this process may indicate a poor build, bad Controller PCB or bad simulator.

Verifying Data Transmission

You can verify data transmission through LYNX terminal's serial ports using a volt meter. The following procedures test data transmission through the 20 mA port and the RS-232 output port. The LYNX terminal serial ports can also be tested through the Diagnostics and Maintenance program block as described in Chapter 3 of this manual.

20 mA

1. Configure the LYNX terminal for Demand mode if it is not already configured as such. This will ensure more accurate test readings.
2. Set the volt meter to read DC milliamps.
3. Put the black lead on the ground connector and the red lead on the CLTX+ connector. In Demand mode, the meter should read approximately 20 mA.

A slow baud rate will cause data to transmit slowly and the meter will fluctuate longer before returning to the original 20 mA reading.

4. Press **ENTER** (to transmit data) and observe the meter reading. The reading should fluctuate indicating transmission, then return to the original 20 mA reading.
5. Reconfigure the LYNX terminal for Continuous mode if it was set to Demand mode for this test.

RS-232 Output

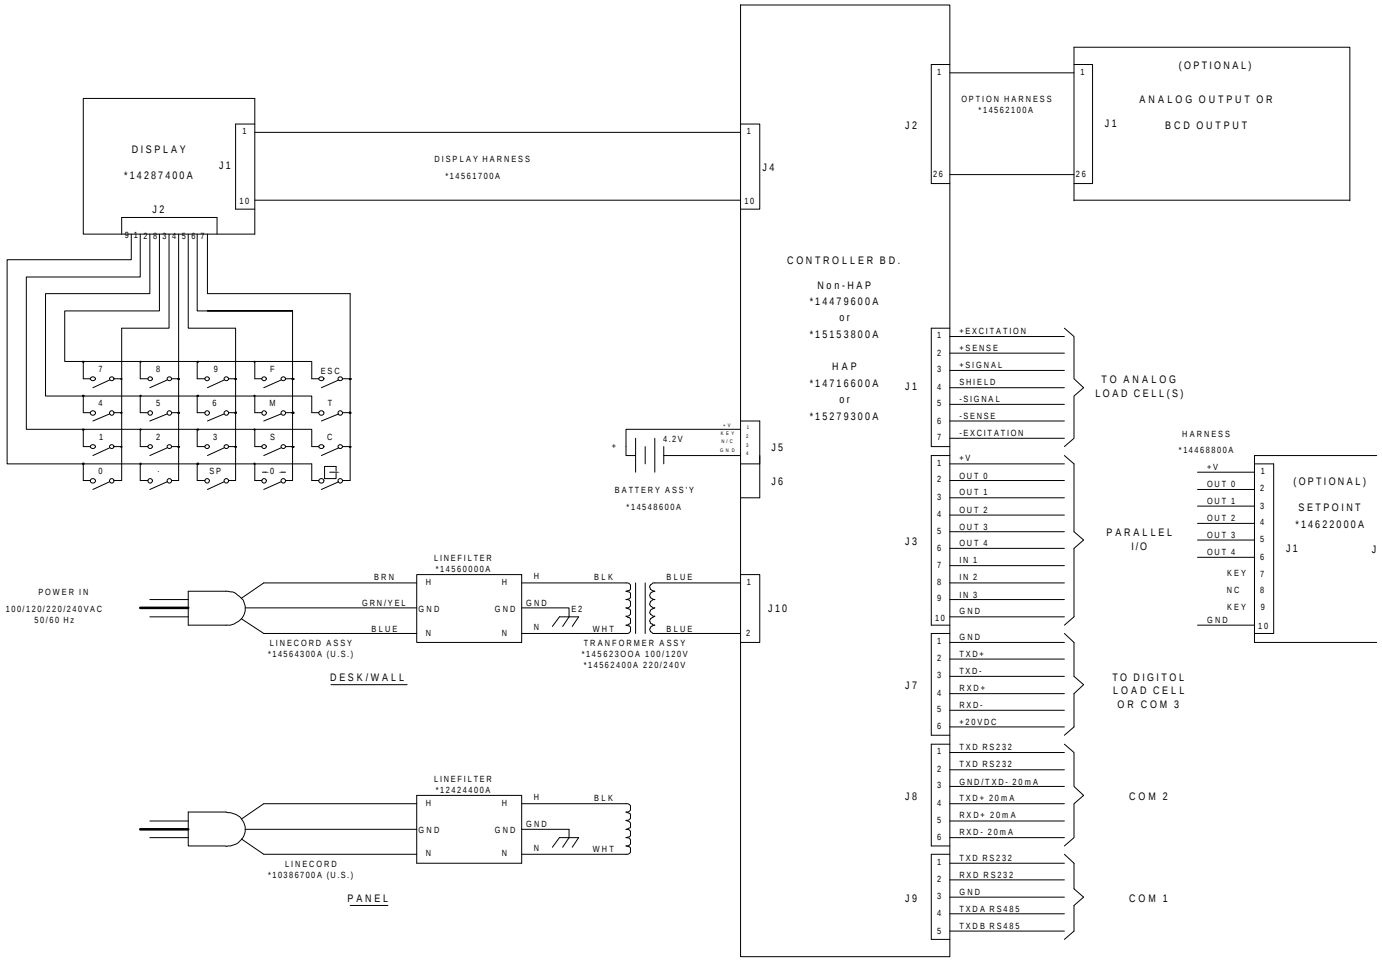
1. Configure the LYNX terminal for Demand mode if it is not already configured as such. This will ensure more accurate test readings.
2. Set the volt meter to read DC volts.
3. Put the black lead on the ground connector and the red lead on the TDX connector. In Demand mode, the meter should read approximately –10 volts.

A slow baud rate will cause data to transmit slowly and the meter will fluctuate longer before returning to the original 20 mA reading.

4. Press **ENTER** (to transmit data) and observe the meter reading. The reading should fluctuate indicating transmission, then return to the original –10 volts reading.
5. Reconfigure the LYNX terminal for Continuous mode if it was set to Demand mode for this test.

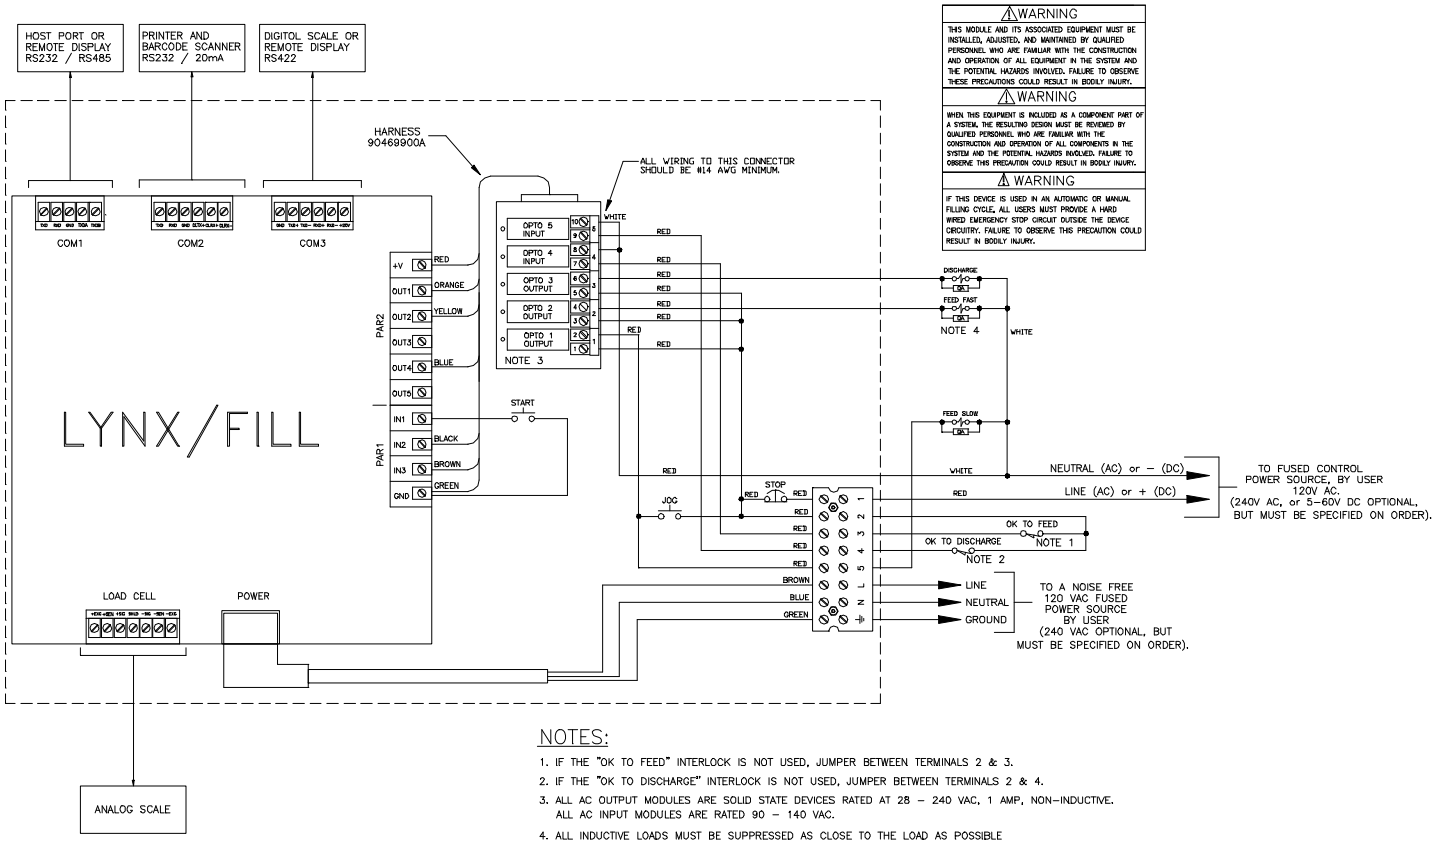
LYNX Terminal Interconnection Diagram

The following interconnect diagram describes wiring connections for the LYNX terminal.



LYNX Filling Controller Interconnect Diagram

The following interconnect diagram describes the wiring connections for the LYNX Filling Controller version.



NOTES:

1. IF THE "OK TO FEED" INTERLOCK IS NOT USED, JUMPER BETWEEN TERMINALS 2 & 3.
2. IF THE "OK TO DISCHARGE" INTERLOCK IS NOT USED, JUMPER BETWEEN TERMINALS 2 & 4.
3. ALL AC OUTPUT MODULES ARE SOLID STATE DEVICES RATED AT 28 – 240 VAC, 1 AMP, NON–INDUCTIVE. ALL AC INPUT MODULES ARE RATED 90 – 140 VAC.
4. ALL INDUCTIVE LOADS MUST BE SUPPRESSED AS CLOSE TO THE LOAD AS POSSIBLE WITH R–C TYPE SUPRESSION DEVICES. (REF. METTLER–TOLEDO PART NUMBER: 962–0034)

NOTES

5 Parts and Accessories

Refer to the following diagrams and data tables when ordering parts and accessories for the LYNX terminal.

General Purpose Parts

6 Appendices

Appendix 1: Serial Interface Reference

Three serial ports are standard on the LYNX terminal Controller PCB. They are designated COM1, COM2, and COM3.

COM1 provides both RS-232 and RS-485 interfaces. The RS-232 interface is a three-wire (TDX, RXD, and GND) with XON/XOFF flow control capabilities (handshaking). The RS-232 is used for loading LYNX software. The RS-485 interface is a two-wire multidrop. Both interfaces can be output simultaneously; however, only one input can be used.

COM2 provides both RS-232 and 20 mA current loop. The RS-232 interface is a three-wire connection with XON/XOFF handshaking capabilities. The 20 mA current loop is an active transmit and passive receive interface. Both interfaces can be output simultaneously; however, only one input can be connected.

COM3 provides a four-wire multidrop RS-422 interface with XON/XOFF handshaking capabilities. COM3 also provides the interface for a DigiTOL scale. If a DigiTOL scale is connected to COM3, that port cannot be used for any other purpose.

Character framing is programmable in the setup mode. Framing can be:

- 1 start bit
- 7 or 8 ASCII data bits (selectable)
- 0 or 1 parity bit (even, odd, [mark, space, on COM2 and COM3], or none)
- 1 stop bit (COM2 and COM3 can have one or two stop bits)

You can also configure the baud rate (from 300 to 38.4K baud) and checksum character interface parameters.

The LYNX terminal uses software handshaking to control data flow commonly referred to as XON/XOFF handshaking. When a receiving device (typically a printer) is getting information from a LYNX terminal and cannot receive any more in its buffer, it sends an ASCII XOFF (13h) telling the LYNX terminal to temporarily stop sending data until its buffer clears.

When the device can receive more data, it sends an ASCII XON (11h) telling the LYNX terminal to begin sending data again. This process can occur as often as required by receiving device.

The XON/XOFF method is the only type of handshaking that is supported by the LYNX terminal.

Hardware Connections

All connections to the serial ports on the LYNX terminal are made using terminal strips. Terminal strips provide an easy, yet more secure connection than other types of connections such as soldering. The terminal strips are removable for ease of connection or replacement of the PCB.

The harsh environment enclosure has grip bushings on the rear cover to properly secure and seal around the serial cable. The panel mount unit has loops on the rear of the panel so you can secure cables with nylon wire ties.

The standard 15-foot RS-232 printer cable) is wired as shown here:

Figure A1-1 RS-232 Printer Cable Wiring

A custom cable (such as a cable to a computer) can also be used. Mettler Toledo recommends using either 20 or 22 gauge wire size. The maximum cable length is determined by the interface type used. As a rule, the following limitations apply:

Cable	Maximum Length
RS-232	50 feet
20 mA	1000 feet
RS-422	2000 feet
RS-485	2000 feet

Connections other than RS-232 are shown in the section entitled Serial Port Connections in Chapter 2. A custom cable to a computer (or other RS-232 device) should be configured as shown below:

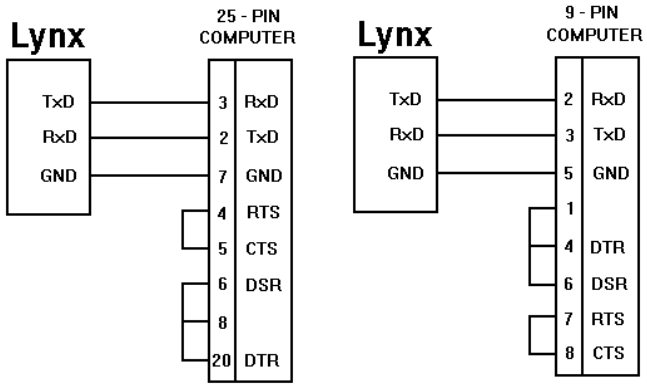

Figure A1-2 Custom Cable Configuration

Output Modes and Formats

The LYNX terminal supports two different modes of data output — demand and continuous.

The demand mode transmits data only when the LYNX terminal receives a print request. Print requests are sent to the LYNX terminal when:

- The operator presses **ENTER**.
- A discrete input is selected as print.
- An ASCII "P" is sent through a command input port
- Auto print is enabled and all conditions for auto print are met.

When triggered, data is transmitted in a string selected in the template editing portion of setup.

Demand mode is used typically when sending data to a printer.

Standard continuous mode transmits a predetermined 18 byte string of data from the serial port at a selectable rate up to 20 Hz (without any request). This mode is used typically when continuous monitoring of the scale weight is required by an external device such as a computer or scoreboard. Mettler Toledo Model 8806 is the only printer that operates in continuous output mode.

The LYNX terminal offers four continuous mode output formats. These are selectable in setup mode and include:

- Standard Continuous Format (with standard status bytes)
- Short Continuous Format (with standard status bytes)
- Standard Continuous Format (with setpoint status bytes)
- Short Continuous Format (with setpoint status bytes)

The standard continuous format is shown below:

Standard Continuous Format

STX	SW A	SW B	SW C	X	X	X	X	X	X	X	X	X	X	X	X	CR	CKS
1	2 STATUS BYTES			3 GROSS / NET WEIGHT						4 TARE WEIGHT						5	6

Table Notes

1. <STX> ASCII Start of Text Character, Hex 02.
2. <SWA>, <SWB>, <SWC> Status Word Bytes A, B, and C. Refer to the Bit Identification Tables for individual bit definition.
3. Displayed weight, either Gross or Net weight. Six digits, no decimal point or sign. Non significant leading zeros are replaced with spaces.
4. Tare weight. Six digits, no decimal point or sign.
5. <CR> ASCII Carriage Return, Hex 0d.
6. <CKS> Optional checksum character, 2's complement of the 7 low order bits of the binary sum of all characters on a line preceding the checksum, including the STX and CR.

The continuous short mode format is provided to allow continuous data output while maintaining high-speed update rates. The short form continuous output differs from the standard continuous output format in that the short format does not send the tare weight data field.

Short Form Continuous Format											
STX	SW A	SW B	SW C	MSD	-	-	-	-	LSD	CR	CKS
1	2 STATUS BYTES			3 GROSS / NET WEIGHT						4	5

Table Notes

1. <STX> ASCII Start of Text Character, Hex 02.
2. <SWA>, <SWB>, <SWC> Status Word Bytes A, B, and C. Refer to the Bit Identification Tables for individual bit definition.
3. Displayed weight. Six digits, no decimal point or sign. Non significant leading zeros are replaced with spaces in the lb weight unit mode.
4. <CR> ASCII Carriage Return, Hex 0d.
5. <CKS> Optional checksum character, 2's complement of the 7 low order bits of the binary sum of all characters on a line preceding the checksum, including the STX and CR.

Standard Status Bytes A, B, and C

The following tables detail the standard status bytes for standard continuous output and standard continuous short output.

Bit Identification Table for Status Byte A			
Bits 0, 1 and 2			
0	**1**	**2**	**Decimal Point Location**
0	0	0	XXXX00
1	0	0	XXXXX0
0	1	0	XXXXXX
1	1	0	XXXXX.X
0	0	1	XXXX.XX
1	0	1	XXX.XXX
0	1	1	XX.XXXX
1	1	1	X.XXXXX
Bits 3 and 4			
3	**4**		**Build Code**
1	0		X1
0	1		X2
1	1		X5
Bit 5			Always = 1
Bit 6			Always = 0

Bit Identification Table for Status Byte B	
Status Bits	Function
Bit 0	Gross = 0, Net = 1
Bit 1	Sign, Positive = 0, Negative = 1
Bit 2	Out of Range = 1 (Over capacity or Under Zero)
Bit 3	Motion = 1
Bit 4	lb = 0, kg = 1 (see also Status Byte C, bits 0-2)
Bit 5	Always = 1
Bit 6	In Power Up = 1

Bit Identification Table for Status Byte C			
Bits 0, 1 and 2			Weight Description
0	1	2	
0	0	0	lb or kg, selected by Status Byte B, bit 4
1	0	0	grams (g)
0	1	0	metric tons (t)
1	1	0	ounces (oz)
0	0	1	troy ounces (ozt)
1	0	1	penny weight (dwt)
0	1	1	tons (ton)
1	1	1	custom units
Bit 3			Print Request = 1
Bit 4			Expand Data x 10 = 1
Bit 5			Always = 1
Bit 6			Hand Tare (Metric Only)

Continuous Setpoint Status Bytes A, B, and C

The continuous output mode format supports setpoint operation. This setpoint format is identical to the standard continuous format except for some differences in the status bytes. The following tables detail the status bytes for the setpoint status byte mode.

The status bytes reflect the two-speed or single-speed mode. If the output is configured as two-speed in the Configure Outputs sub-block of the Discrete program block (see Chapter 3), the status byte will include a fast feed and standard feed for two setpoints. If the output is configured as single-speed, the feed for setpoints 1-4 is reflected in the continuous output.

Bit Identification Table for Status Byte A			
Bits 0, 1 and 2			
0	1	2	Decimal Point Location
0	0	0	XXXX00
1	0	0	XXXXX0
0	1	0	XXXXXX
1	1	0	XXXXX.X
0	0	1	XXXX.XX
1	0	1	XXX.XXX
0	1	1	XX.XXXX
1	1	1	X.XXXXX
Bit 3	Setpoint 1, Feeding = 0		
Bit 4	Setpoint 2, Feeding = 0		
Bit 5	Always = 1		
Bit 6	Setpoint 3, Setpoint 1 Fast, Feeding = 0		

Bit Identification Table for Status Byte B	
Status Bits	Function
Bit 0	Gross = 0, Net = 1
Bit 1	Sign, Positive = 0, Negative = 1
Bit 2	Out of Range = 1 (Over capacity or Under Zero)
Bit 3	Motion = 1
Bit 4	lb = 0, kg = 1 (see also Status Byte C, bits 0-2)
Bit 5	Always = 1
Bit 6	Setpoint 1, Weight Tolerance or Zero Tolerance; In Tolerance = 0, Out Tolerance = 1

Bit Identification Table for Status Byte C			
Bits 0, 1 and 2			
0	1	2	Weight Description
0	0	0	lb or kg, selected by Status Byte B, bit 4
1	0	0	grams (g)
0	1	0	metric tons (t)
1	1	0	ounces (oz)
0	0	1	troy ounces (ozt)
1	0	1	penny weight (dwt)
0	1	1	tons (ton)
1	1	1	custom units
Bit 3			Print Request = 1
Bit 4			Setpoint 4, Setpoint 2 Fast, Feeding = 0
Bit 5			Always = 1
Bit 6			Setpoint 2, Weight in Tolerance 20, Out = 1

Default Template Formats

The LYNX terminal's default format templates are as follows:

Template 1

Literal #1
Literal #2
Current Time Current Date CN

GROSS WEIGHT: XX.XX lb
TARE WEIGHT: XX.XX lb
NET WEIGHT: XX.XX lb

Template 2

Literal #1
Literal #2
Current Time Current Date CN

Prompt #1 Response #1
Prompt #2 Response #2
Prompt #3 Response #3

GROSS WEIGHT: XX.XX lb
TARE WEIGHT: XX.XX lb
NET WEIGHT: XX.XX lb

Accumulation Totals Report

Literal String 9
Literal String 10
CURRENT TIME CURRENT DATE
TRANSACTIONS XXXXXXXX (units)
SUBTOTAL XXXXXXXX (units)
TOTAL XXXXXXXX (units)

ID/Tare Records Report (Temporary Registers)

TEMPORARY REGISTERS
TIME DATE

ID	RECORD ID	DESCRIPTION	WEIGHT (unit)
21	XXXXXX	XXX-XXX	XXXXX
22	XXXXXX	XXX-XXX	XXXXX
23	XXXXXX	XXX-XXX	XXXXX

ID/Tare Records Report (Permanent Registers)

PERMANENT REGISTERS
TIME DATE

ID	RECORD ID	DESCRIPTION	TARE (unit)	TOTAL (unit)	TRANS
21	XXXXXX	XXX-XXX	XXXXX	XXXXX	X
22	XXXXXX	XXX-XXX	XXXXX	XXXXX	X
23	XXXXXX	XXX-XXX	XXXXX	XXXXX	X

The LYNX terminal templates are limited to 800 characters. The total number of characters used by each template can be calculated using the following chart:

Print Field	Space Used
LYNX Data Field	7 characters
ASCII Character	1 character
Special ASCII Character	1 character
Justify a Field	2 characters + justify letter (L, R, C) + space limit (1, 2, or 3 characters)
CR/LF Characters	6 characters + quantity (1 or 2)
Repeat Character	5 characters

Consider the following example where a customer ticket has three centered literals in a 40 character-wide field, and an asterisk underline. You can calculate how much of the template remains for field data as follows:

CHARLIE'S AUTO SALVAGE YARD

CASH FOR YOUR OLD WRECKS!

ANY MODEL - ANY YEAR

****

The space required for this ticket heading information is

Character Description	Character Total
Literal 1	7 (LYNX data field)
Centered (Justify in 40 character field)	2 + 1 (letter C) + 2 (two digits for quantity 40)
CR/LF	6 + 1 (one digit for quantity 1)
Total space required (each line)	19
Total for all three lines (19 x 3)	57
ASCII (*)	1 (ASCII character)
Repeat (*) 40 times	5 (repeat function)
CR/LF	6 + 1 (one digit for quantity 1)
Total space for line of asterisks	13
Grand total of characters (57 + 13)	70
Therefore 730 characters remain in this template (800-70)	

The following hints apply to template space calculation:

- Regardless of the number of characters in a LYNX terminal data field, a template uses only seven characters (the field code).
- Use the CR then the LF special ASCII characters (two characters) instead of the CR/LF combination (7 to 8 characters).
- Justification uses four to six characters that are not used if the field remains unjustified.

ASCII Characters

The charts on the following pages list the ASCII Standard and Control characters and ASCII Special characters that are used in the LYNX terminal templates.

The character set for the Lynx terminal and the printer are the same.

The first chart below gives replacement characters for display (and printing) purposes depending on the character set selected in the Application Environment program block (see Chapter 3) and the printer setup selection.

The second chart, ASCII Standard and Control Characters, gives the ASCII character, decimal (Dec.), and hexadecimal (Hex.) value for each ASCII character from 00 to 127 decimal.

The third chart, ASCII Characters in Special Character Set, gives the ASCII character, name, and hexadecimal (Hex.) value for the characters that can be used as "special characters" in template programming. These include all the of the characters not already available on the standard LYNX terminal keypad.

Appendix 2: Host Commands

The LYNX terminal allows selection between three host protocols for computer interfacing or high precision scale interface applications. Protocol may be configured as the Mettler Toledo Model 8142 protocol, the Mettler Toledo Model LYNX protocol, or the Standard Interface Command Set (SICS) used with High Precision Products. A complete serial port is required for a host connection.

8142 Host Protocol

Two basic types of communication can occur between the host and the LYNX terminal:

- Upload—The host requests information from the LYNX terminal. The LYNX terminal responds to the request.
- Download—The host transmits new data to the LYNX terminal.

Data Packet Format

All transmissions by the host or the LYNX terminal port must be in the data packet format shown:

Port Data Packet Format							
Data	STX	ADR	DIR	FCT	Data Field	CR	CHK
Notes	1	2	3	4	5	6	7

Table Notes:
1 <STX> ASCII Start of Text Character, Hex 02.
2 <ADR> LYNX scale address selected in setup, must be from an ASCII 2 to 9.
3 <DIR> Data Direction, "U" = Upload (LYNX to Host), "D" = Download (Host to LYNX).
4 <FCT> Function code, refer to Function Code Table.
5 <Data Field> The data field is either the uploaded data from the LYNX terminal or the downloaded data from the host. Not all function codes use the data field.
6 <CR> ASCII Carriage Return, Hex 0D.
7 <CKS> Optional Checksum Character, 2's complement of the 7 low order bits of the binary sum of all characters on a line, preceding the checksum.

Host Port Function Codes

Decimal points, weight units and descriptors are not included in data fields.

The function code in the data packet determines what operation or data is assessed in the LYNX terminal. The codes for the various functions are listed in the Function Code Table with the valid direction of the communication (upload or download) and the length of the transmitted data field.

No error detection beyond checksum is provided for downloads by the port. When critical data such as setpoint data is downloaded from the host to the LYNX terminal, it is recommended that the host device upload (read back) the data downloaded to the LYNX terminal to verify that the data was received correctly.

Function Code Description	Function Code		Direction	Data Field Length
	Hex	ASCII		
All Functions	41	A	U	187
Displayed Weight	42	B	U	7
Gross Weight	43	C	U	7
Tare Weight	44	D	U/D	7
Net Weight	45	E	U	7
Time and Date	46	F	U/D	12
Current Consecutive Number	47	G	U/D	6
Clear Oldest Transaction from Memory	48	H	U/D	0
Status Bytes	49	I	U	6
Control Bytes	4B	K	U/D	3
Setpoints 1,2,3,4	4C	L	U/D	24
Zero Tolerance 1,2	4D	M	U/D	12
#1 Setpoint, Dribble, Preact, Tolerance	4E	N	U/D	24
#2 Setpoint, Dribble, Preact, Tolerance	4F	O	U/D	24
Response to Prompt 1	50	P	U/D	6
Last Printed Data from Printer Port	51	Q	U	*
Clear Transaction Memory	52	R	D	0
Transactions Still Available to Read	53	S	U	4
Sub-Total Accumulator	54	T	U	10
Total Accumulator	55	U	U	10

* The field length is 45 bytes (compatible with 8142 format) when the print template ptp03 is empty. If there is a format in ptp03 then this length will vary accordingly.

Host Port Function Codes

(A) All Functions (Upload Only)

Host Transmission					
ASCII	STX	2	U	A	CR
Hex	02	32	55	41	0D

LYNX Response					
STX	2	U	A	All Functions 187 Byte Data Field	CR
02	32	55	41		0D

The All Functions Data Field consists of:

- Displayed Weight: (7 Bytes)
- Gross Weight: (7 Bytes)
- Tare Weight: (7 Bytes)
- Net Weight: (7 Bytes)
- Time/Date: (12 Bytes)
- Next Consecutive Number: (6 Bytes)
- Status Bytes: (6 Bytes)
- Setup Bytes (12 Bytes)
- Setpoints 1,2,3,4: (24 Bytes)
- Setpoint-1, Dribble-1, Preact-1, Tol-1: (24 Bytes)
- Setpoint-2, Dribble-2, Preact-2, Tol-2: (24 Bytes)
- Response to Prompt 1: (6 Bytes)
- Not used: (All 0's)

The most significant digit of the weight data fields will be a space for positive weights and a minus for negative weights.

Weight data fields never contain decimal point or dummy zero.

(B) Displayed Weight (Upload Only)

Host Transmission					
ASCII	STX	2	U	B	CR
Hex	02	32	55	42	0D

LYNX Response					
STX	2	U	B	Displayed Weight 7 Byte Data Field	CR
02	32	55	42		0D

(C) Gross Weight (Upload Only)

Host Transmission					
ASCII	STX	2	U	C	CR
Hex	02	32	55	43	0D

LYNX Response					
STX	2	U	C	Gross Weight 7 Byte Data Field	CR
02	32	55	43		0D

(D) Tare Weight (Upload)

Host Transmission					
ASCII	STX	2	U	D	CR
Hex	02	32	55	44	0D

LYNX Response					
STX	2	U	D	Tare Weight 7 Byte Data Field	CR
02	32	55	44		0D

(D) Tare Weight (Download)

Host Transmission						
ASCII	STX	2	D	D	Tare Weight 7 Byte Data Field	CR
Hex	02	32	44	44		0D

(E) Net Weight (Upload Only)

Host Transmission					
ASCII	STX	2	U	E	CR
Hex	02	32	55	45	0D

LYNX Response					
STX	2	U	E	Net Weight 7 Byte Data Field	CR
02	32	55	45		0D

(F) Time/Date (Upload)

The time format to the LYNX terminal is fixed as HHMMSS. The date format is DDMMYY.

Host Transmission					
ASCII	STX	2	U	F	CR
Hex	02	32	55	46	0D

LYNX Response					
STX	2	U	F	Time and Date 12 Byte Data Field	CR
02	32	55	46		0D

(F) Time/Date (Download)

Host Transmission						
ASCII	STX	2	D	F	Time and Date 12 Byte Data Field	CR
Hex	02	32	44	46		0D

Only the six least significant digits are sent using this command. The two most significant digits are not available.

(G) Next Consecutive Number (Upload)

Host Transmission					
ASCII	STX	2	U	G	CR
Hex	02	32	55	47	0D

LYNX Response					
STX	2	U	G	Current Consecutive Number 6 Byte Data Field	CR
02	32	55	47		0D

(G) Next Consecutive Number (Download)

Host Transmission						
ASCII	STX	2	D	G	Current Consecutive Number 6 Byte Data Field	CR
Hex	02	32	44	47		0D

(H) Clear Oldest Transaction from Memory (Download or Upload)

Host Transmission					
ASCII	STX	2	D or U	H	CR
Hex	02	32	44 or 45	48	0D

(I) Status Bytes (Upload Only)

Host Transmission					
ASCII	STX	2	U	I	CR
Hex	02	32	55	49	0D

LYNX Response					
STX	2	U	I	Status Bytes 6 Byte Data Field	CR
02	32	55	49		0D

Bit Identification Table for Status Byte A			
Bits 0, 1 and 2			
0	1	2	Decimal Point Location

(K) Control Bytes (Download)

Only 1 control byte function can be used at a time. If more than 1 control byte function is desired then repeat the control byte function once for each function desired.

Control bytes A and B are used to control the display. Control byte C is used to clear subtotal and total accumulators.

Host Transmission								
ASCII	STX	2	D	K	CBA	CBB	CBC	CR

(L) Setpoints 1, 2, 3, 4 (Upload)

All four setpoints must be downloaded even if only one setpoint is being changed. Each setpoint value is six numeric digits with no decimal point. Setpoint #5 (if used) is not available to the host port.

Host Transmission					
ASCII	STX	2	U	L	CR
Hex	02	32	55	4C	0D

LYNX Response					
STX	2	U	L	Setpoints 1, 2, 3, 4 Byte Field	CR
02	32	55	4C		0D

(L) Setpoints 1, 2, 3, 4 (Download)

Host Transmission						
ASCII	STX	2	D	L	Setpoints 1, 2, 3, 4 Byte Field	CR
Hex	02	32	44	4C		0D

(M) Zero Tolerance (Upload)

Zero tolerance is used only when zero tolerance is selected for setpoint 1 and setpoint is a 2-speed setpoint. The value for both zero tolerances must be downloaded. Each tolerance value is six numeric digits with no decimal point. The second tolerance value is not used but must be included.

Host Transmission					
ASCII	STX	2	U	M	CR
Hex	02	32	55	4D	0D

LYNX Response					
STX	2	U	M	Zero Tolerance 1,2 12 Byte Field	CR

(O) #2 Setpoint, Dribble, Preact, Weight Tolerance (Download)

Host Transmission						
ASCII	STX	2	D	O	#2: Setpoint, Dribble, Preact, Tolerance. 24 Byte Field	CR
Hex	02	32	44	4F		0D

(P) Response to Prompt #1 (Upload)

Only the six least significant characters are available with this command.

Host Transmission					
ASCII	STX	2	U	P	CR
Hex	02	32	55	50	0D

LYNX Response					
STX	2	U	P	ID 6 Byte Field	CR
02	32	55	50		0D

(P) Numeric ID (Download)

Host Transmission						
ASCII	STX	2	D	P	ID	CR
Hex	02	32	44	50	6 Byte Field	0D

(Q) Last Printed Data (Upload)

This function code will return the last printed data in the format specified by print template ptp03. If ptp03 is cleared to a blank condition, the response from the LYNX terminal duplicates the format of the 8142. The 8142 format is shown below.

Host Transmission					
ASCII	STX	2	U	Q	CR
Hex	02	32	55	51	0D

LYNX Response						
ASCII	STX	2	U	Q	Data per ptp03	CR
Hex	02	32	55	51	(default 45 bytes)	0D

Format for ptp03 when it is cleared.

Data	Length
Gross Weight	7
Tare Weight	7
Net Weight	7
Time	6
Date	6
CN	6
(ID)Var01	6

The Lynx terminal can be configured to warn the operator and halt printing if the transaction memory buffer becomes full. Refer to the Memory Program block.

If Template ptp03 is not blank, the LYNX terminal operates in a slightly different mode. It uses approximately 4K of memory as a transaction memory buffer to store all fields programmed in ptp03 for each transaction. To retrieve the oldest transaction record, the host sends the “Q” command then an “H” command to clear this record. The host then sends another “Q” command for the next transaction then an “H” to clear that record. Using this sequence, all transactions can be retrieved from the LYNX terminal. The following is an example of this mode.

Data fields in custom template ptp03:

Data	Length
Var01 (Product)	12
Var02 (Operator)	10
Time	5
Net Weight	6

Host Transmission to Retrieve Transaction #1					
ASCII	STX	2	U	Q	CR
Hex	02	32	55	51	0D

LYNX Response with Transaction #1 Data					
STX	2	U	Q	Data from ptp03	CR
02	32	55	51	(33 bytes)	0D

Host Transmission to Clear Transaction #1					
ASCII	STX	2	U	H	CR
Hex	02	32	55	48	0D

LYNX Response to Clear Transaction #1					
ASCII	STX	2	U	H	CR
Hex	02	32	55	48	0D

Host Transmission to Retrieve Transaction #2					
ASCII	STX	2	U	Q	CR
Hex	02	32	55	51	0D

LYNX Response with Transaction #2 Data					
STX	2	U	Q	Data from ptp03	CR
02	32	55	51	(33 bytes)	0D

Host Transmission to Clear Transaction #2					
ASCII	STX	2	U	H	CR
Hex	02	32	55	48	0D

LYNX Response to Clear Transaction #2					
ASCII	STX	2	U	H	CR
Hex	02	32	55	48	0D

This sequence will be repeated until all transactions have been retrieved. After the last transaction has been retrieved and cleared, the next host request will be responded to with no data by the LYNX terminal. This indicates the transaction buffer is empty. The host can also use a "S" command to ascertain the number of available transactions.

(R) Clear Transaction Memory (Download) – Clears Total Buffer

Host Transmission					
ASCII	STX	2	D	R	CR
Hex	02	32	44	52	0D

(S) Transactions Still Available to Read (Upload)

Host Transmission					
ASCII	STX	2	U	S	CR
Hex	02	32	55	53	0D

LYNX Response					
STX	2	U	S	# of Transactions 4 Byte Data Field	CR
02	32	55	53		0D

(T) Subtotal Accumulator (Upload Only)

Host Transmission					
ASCII	STX	2	U	T	CR
Hex	02	32	55	54	0D

LYNX Response					
STX	2	U	T	Subtotal Accumulator 10 Byte Data Field	CR
02	32	55	54		0D

(U) Total Accumulator (Upload Only)

Host Transmission					
ASCII	STX	2	U	U	CR
Hex	02	32	55	55	0D

LYNX Response					
STX	2	U	U	Total Accumulator 10 Byte Data Field	CR
02	32	55	55		0D

8530 Host Protocol Transaction

The data format used by the LYNX Protocol is either a 10 or 11 bit ASCII frame which consists of:

- 1 start bit
- 7 data bits
- 1 selectable parity bit
- 1 or 2 stop bits

A selectable checksum character is provided to ensure the integrity of the data.

There are 2 basic types of communication that occur between the host and the LYNX terminal:

- Upload—The host requests information from the LYNX terminal. The LYNX terminal responds to the request.
- Download—The host transmits new data to the LYNX terminal.

Data Packet Format

All transmissions by the host or the LYNX terminal are in the format shown below

Data	STX	ADR	DIR	FCT	Data Field	CR	CHK
Notes	A	B	C	D	E	F	G

Table Notes:
A <STX> ASCII Start of Text Character, Hex 02.
B <ADR> LYNX scale address selected in setup, must be from an ASCII 2 to 9.
C <DIR> Data Direction, "U" = Upload (8142 to Host), "D" = Download (Host to LYNX)
D <FCT> Function code, refer to Function Code Table 6-9.
E <Data Field> The data field is either the uploaded data from the 8142 or the downloaded data from the host. Not all function codes use the data field.
F <CR> ASCII Carriage Return, Hex 0D
G <CKS> Optional Checksum Character, 2's complement of the 7 low order bits of the binary sum of all characters on a line, preceding the checksum.

Host Interface Message Format

Host Port Function Codes

No error detection beyond checksum is provided for downloads. The LYNX terminal ignores any command it does not understand. When critical data such as setpoint data is downloaded from the host to the LYNX terminal, it is recommended that the host device upload (read back) the data downloaded to the LYNX terminal to verify that the data was received correctly.

Function Code Description	Function Code		Direction	Data Field Length
	Hex	ASCII		
Read All Functions	41	A	U	116
Displayed Weight	42	B	U	8
Gross Weight	43	C	U	8
Tare Weight	44	D	U/D	8
Net Weight	45	E	U	8
Time and Date	46	F	U/D	12
Current Consecutive Number	47	G	U/D	6
Status Bytes	49	I	U	2
Setup Bytes	4A	J	U/D	2
Control Bytes	4B	K	D	2
Setpoint 1	4C	L	U/D	7
Setpoint 2	4D	M	U/D	7
Setpoint 3	4E	N	U/D	7
Setpoint 4	4F	O	U/D	7
ID	50	P	U/D	12
Subtotal Accumulator	51	Q	U	11
Total Accumulator	52	R	U	11

(A) Read All Functions (Upload Only)

Host Transmission					
ASCII	STX	2	U	A	CR
Hex	02	32	55	41	0D

LYNX Response					
STX	2	U	A	All Functions 116 Byte Data Field	CR
02	32	55	41		0D

Weight data fields will include decimal point and sign character if necessary.

The All Functions Data Field Consists of:

- Displayed Weight: (8 Bytes)
- Gross Weight: (8 Bytes)
- Tare Weight: (8 Bytes)
- Net Weight: (8 Bytes)
- Time/Date: (12 Bytes)
- Next Consecutive Number: (6 Bytes)
- Status Bytes: (2 Bytes)
- Setup Bytes: (2 Bytes)
- Setpoint 1: (7 Bytes)
- Setpoint 2: (7 Bytes)
- Setpoint 3: (7 Bytes)
- Setpoint 4: (7 Bytes)
- ID: (12 Bytes)
- Subtotal Accumulator: (11 Bytes)
- Total Accumulator: (11 Bytes)

(B) Displayed Weight (Upload Only)

Host Transmission					
ASCII	STX	2	U	B	CR
Hex	02	32	55	42	0D

LYNX Response					
STX	2	U	B	Displayed Weight 8 Byte Data Field	CR
02	32	55	42		0D

(C) Gross Weight (Upload Only)

Host Transmission					
ASCII	STX	2	U	C	CR
Hex	02	32	55	43	0D

LYNX Response					
STX	2	U	C	Gross Weight 8 Byte Data Field	CR
02	32	55	43		0D

(D) Tare Weight (Upload)

Host Transmission					
ASCII	STX	2	U	D	CR
Hex	02	32	55	44	0D

LYNX Response					
STX	2	U	D	Tare Weight 8 Byte Data Field	CR
02	32	55	44		0D

(D) Tare Weight (Download)

Downloaded tare weight value must match the displayed increment type and size programmed into the Lynx terminal or else the downloaded value is ignored.

Host Transmission						
ASCII	STX	2	D	D	Tare Weight 8 Byte Data Field	CR
Hex	02	32	44	44		0D

(E) Net Weight (Upload Only)

Host Transmission					
ASCII	STX	2	U	E	CR
Hex	02	32	55	45	0D

LYNX Response					
STX	2	U	E	Net Weight 8 Byte Data Field	CR
02	32	55	45		0D

(F) Time/Date (Upload)

Host Mode time and date format is [HHMMSSDDMMYY] HH = hours, MM = minutes, SS = seconds, DD = day, MM = month and YY = year.

Host Transmission					
ASCII	STX	2	U	F	CR
Hex	02	32	55	46	0D

LYNX Response					
STX	2	U	F	Time and Date 12 Byte Data Field	CR
02	32	55	46		0D

(F) Time/Date (Download)

Host Transmission						
ASCII	STX	2	D	F	Time and Date 12 Byte Data Field	CR
Hex	02	32	44	46		0D

(G) Next Consecutive Number (Upload)

Host command function code H (hex value 48) is not used with the 8530 host interface.

Host Transmission					
ASCII	STX	2	U	G	CR
Hex	02	32	55	47	0D

LYNX Response					
STX	2	U	G	Current Consecutive Number 6 Byte Data Field	CR
02	32	55	47		0D

(G) Next Consecutive Number (Download)

Host Transmission						
ASCII	STX	2	D	G	Current Consecutive Number 6 Byte Data Field	CR
Hex	02	32	44	47		0D

(I) Status Bytes (Upload Only)

Status bytes 1 and 2 provide information about the operation of the LYNX terminal.

Host Transmission					
ASCII	STX	2	U	I	CR
Hex	02	32	55	49	0D

LYNX Response						
STX	2	U	I	S	S	CR
02	32	55	49	B 1	B 2	0D

Status Byte 1 Bit Definition	
Function	**Bit**
Gross/Net, Net=1	0
Negative Weight = 1	1
Overcapacity=1	2
Motion=1	3
Lb/kg, kg=1	4
Powerup not zeroed	5
Always a 1	6

Status Byte 2 Bit Definition	
Function	**Bit**
Setpoint 1, Feeding = 1	0
Setpoint 2, Feeding = 1	1
Setpoint 3, Feeding = 1	2
Setpoint 4, Feeding = 1	3
Print Request = 1	4
Expanded Weight Display = 1	5
Always a 1	6

(K) Control Bytes

Only one control byte function can be used at a time. If more than 1 control byte function is desired then repeat the control byte function once for each function desired.

Host Transmission							
ASCII	STX	2	D	K	C B A	C B B	CR
Hex	02	32	44	4B			0D

Control Byte A Bit Definition	
Function	**Bit**
Print Request = 1	0
Switch to lb = 1	1
Switch to kg = 1	2
Clear Tare = 1	3
Autotare = 1	4
Zero = 1	5
Always = 1	6

Control Byte B Bit Definition	
Function	**Bit**
Reserved	0
Reserved	1
Reserved	2
Reserved	3
Reserved	4
Reserved	5
Always = 1	6

Control Byte A example:

Print—A @ (41, 40 hex)
Switch to lb—B @ (42, 40 hex)
Switch to kg—D @ (44, 40 hex)
Clear Tare—H @ (48, 40 hex)
Autotare—P @ (50, 40 hex)
Zero—‘ @ (60, 40 hex)
Clear Accumulators—@ A (40, 41 hex)
Set Default Parameters—@ B (40, 42 hex)

(L) Setpoints 1, 2, 3 and 4 (Upload/Download)

The setpoint values for setpoints 1, 2, 3 or 4, are accessed individually by function codes "L", "M", "N" or "P", (hex values 4C, 4D, 4E or 4F) for setpoints 1, 2, 3, or 4.

Host Transmission					
ASCII	STX	2	U	L	CR
Hex	02	32	55	4C	0D

LYNX Response					
STX	2	U	L	Setpoint 1 7 Byte Data Field	CR
02	32	55	4C		0D

(L) Setpoints 1, 2, 3, 4 (Download)

Downloaded setpoint value must match the displayed increment type and size programmed into the Lynx terminal or else the downloaded value is ignored. It is highly recommended that you upload the setpoint data after a download to verify that the Lynx terminal has accepted the downloaded setpoint value.

Host Transmission						
ASCII	STX	2	D	L	Setpoint 1 7 Byte Data Field	CR
Hex	02	32	44	4C		0D

(P) Numeric ID (Upload)

Host Transmission					
ASCII	STX	2	U	P	CR
Hex	02	32	55	50	0D

LYNX Response					
STX	2	U	P	ID 12 Byte Field	CR
02	32	55	50		0D

(P) Numeric ID (Download)

Host Transmission						
ASCII	STX	2	D	P	ID 12 Byte Field	CR
Hex	02	32	44	50		0D

(Q) Subtotal Accumulator (Upload Only)

Host Transmission					
ASCII	STX	2	U	Q	CR
Hex	02	32	55	51	0D

LYNX Response					
STX	2	U	Q	Subtotal Accumulator 11 Byte Data Field	CR
02	32	55	51		0D

(R) Total Accumulator (Upload Only)

Host Transmission					
ASCII	STX	2	U	R	CR
Hex	02	32	55	52	0D

LYNX Response					
STX	2	U	R	Total Accumulator 11 Byte Data Field	CR
02	32	55	52		0D

Standard Interface Command Set (SICS) Protocol

All new METTLER TOLEDO balances and instruments support the standardized command set "METTLER TOLEDO Standard Interface Command Set" (MT-SICS), which is divided into 4 levels, depending on the functionality of the device:

- MT-SICS level 0—Command set for the simplest device.
- MT-SICS level 1—Extension of the command set for standard devices.

A feature of this concept is that the commands combined in MT-SICS level 0 and 1 are identical for all devices. Both the simplest weighing device and a fully expanded weighing work station recognize the commands of MT-SICS level 0 and 1.

MT-SICS Level 0 and 1 Command Functions
You can use the commands of MT-SICS level 0 and 1 to perform the following functions with a LYNX terminal:

- Request weighing results
- Tare the scale and preset the tare weigh
- Zero the scale
- Identify MT-SICS implementation
- Identify the device
- Reset the device

Data Interface Configuration
Setting of the interface such as baud rate, number of data bits, parity, handshake protocols and connector pin assignments are described in the Configure Serial I/O Program Block in Chapter 2.

Version number of the MT-SICS
Each level of the MT-SICS has its own version number can be requested with the command I1 from level 0.

This section describes:

- MT-SICS level 0, version 2.1x
- MT-SICS level 1, version 2.1x (only partially implemented in the LYNX terminal)

Command Formats

Each command received by the scale via the data interface is acknowledged by a response of the device to the transmitter. Commands and responses are data strings with a fixed format.

Commands sent to the LYNX terminal comprise one or more characters of the ASCII character set.

Enter commands only in uppercase.

- The parameters of the command must be separated from one another and from the command name by a space (ASCII 32 dec., in this description represented as _).
- Each command must be terminated by CR LF (ASCII 13 dec., 10 dec.)

The characters CR and LF, which can be inputted using the **ENTER** or **RETURN** key of most entry keypads, are not listed in this description. However, it is essential they be included for communication with the LYNX terminal.

Example

Command to tare the LYNX terminal:

"TA_20.00_lb" (The command terminator CR LF is not shown.)

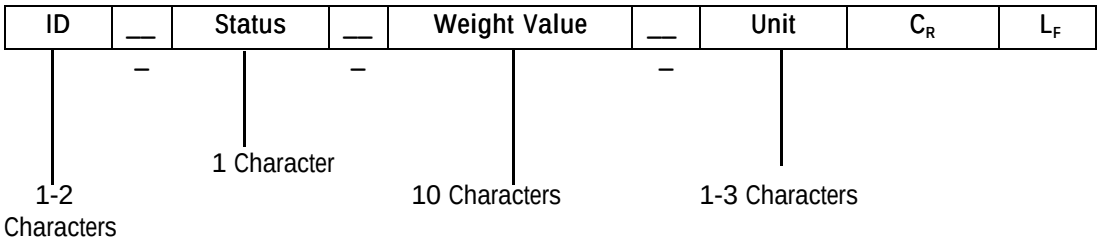
Response Formats

All responses sent by the LYNX terminal to the transmitter to acknowledge the received command have one of the following formats:

- Response with weight value
- Response without weight value
- Error message

Format of the Response with Weight Value

A general description of the response with weight value is the following:



- ID—Response identification.
- _— Space (ASCII 32 dec.)
- Status—Status of the LYNX terminal. See description of the commands and responses
- Weight Value—Weighing result: shown as number with 10 digits, including sign directly in front of the first digit. The weight value appears right-justified. Preceding zeroes are suppressed with the exception of the zero to the left of the decimal point.
- Unit—Weight unit displayed.
- CR—Carriage Return (ASCII 13 dec.)
- LF—Line Feed (ASCII 10 dec.)

Comment—CR LF will not be shown in this description.

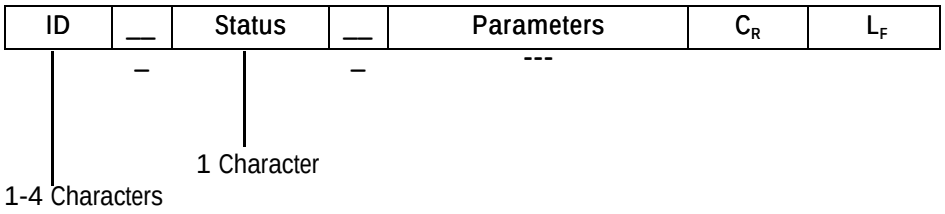
Example

Response with stable weight value of 0.256 g:

S _ S_ _ _ _ _ _ 0.256 _ g

Format of the Response Without Weight Value

A general description of the response without weight value is the following:



- ID—Response identification.
- _—Space (ASCII 32 dec.)
- Status—Status of the LYNX terminal. See description of the commands and responses
- Parameters—Command-dependent response code.
- CR—Carriage Return (ASCII 13 dec.)
- LF—Line Feed (ASCII 10 dec.)

Comment—CR LF will not be shown in this description

Error messages

ID	C_R	L_F

- ID—Error Identification

There are three different error messages. The identification always comprises two characters.

  - ES—Syntax error
    The LYNX terminal has not recognized the received command.
  - ET—Transmission error
    The scale has received a “faulty” command, e.g. a parity error.
  - EL—Logical error
    The LYNX terminal can not execute the received command.

- CR—Carriage return (ASCII 13 dec.)
- LF—Line Feed (ASCII 10 dec.)

Comment—CR LF will not be shown in this description.

Tips for the Programmer

Command and Response
You can improve the dependability of your application software by having your program evaluate the response of the LYNX terminal to a command. The response is the acknowledgment that the LYNX terminal has received the command.

Reset
To be able to start from a determined state, when establishing the communication between the LYNX terminal and system, you should send a reset command to the LYNX terminal. When the LYNX terminal or system is switched on or off, faulty characters can be received or sent.

Quotation Marks (“ ”)
Quotation marks included in the command must always be entered.

Commands and Responses MT-SICS Level 0

The LYNX terminal receives commands from the system computer and acknowledges the command with an appropriate response. The following sections contain a detailed description of the command set in alphabetical order with the associated responses. Commands and responses are closed with CR and LF. These termination characters are not shown in the following description, but they must always be entered with commands or sent with responses.

The commands of MT-SICS level 0 are available with even the simplest devices which support the METTLER TOLEDO Standard Interface Command Set. These include:

- I1 Inquiry of MT-SICS level and MT-SICS versions
- I2 Inquiry of LYNX data
- I3 Inquiry of LYNX SW version and type definition number
- I4 Inquiry of serial number
- S Send stable weight value
- SI Send weight value immediately
- SIR Send weight value immediately and repeat
- T Tare
- Z Zero
- @ Reset

The following is a detailed description of each of these Level 0 commands:

1. **I1**—INQUIRY OF MT-SICS LEVEL AND MT-SICS VERSIONS

Command: I1—Inquiry of MT-SICS level and MT-SICS versions

Response—I 1 _ A _ "0" _ "2.10" _ "2.10" _ " " _ " "

- 0 Level 0 fully implemented
- 2.10 Level 0, version V2.10
- 2.10 Level 1, version V2.10 (only partially implemented in LYNX)
- " No MT-SICS 2 commands
- " No MT-SICS 3 commands

Comments

- In the case of the MT-SICS level, only fully implemented levels are listed. In other words, if it is not possible to implement all commands from a certain level, the level is not specified.
- In the case of the MT-SICS version, all levels are specified even those only partially implemented.

2. I2—INQUIRY OF DATA

Command: I2—Inquiry of data.

Response: I 2 _ A _ "LYNX _ C _ Standard _100.00 lb"

Comments

- The number of characters of "text" depends on the capacity.

3. **I3**—INQUIRY OF SW VERSION AND TYPE DEFINITION NUMBER

Command I3: Inquiry of SW version number(s) and type definition number.

Response: I3 _ A _ "0.00 _ 0.00 _ D145828R"

- 0.00--SW version of OS (not implemented)
- 0.00--SW version of the application (not implemented)
- D145828R--Type definition number (application SW version)

Comment

- The number of characters of "text" depends on the device type.

4. I4—INQUIRY OF SERIAL NUMBER

Command: I4—Inquiry of serial number.

Response: I4 _ A _ “text”

- Serial number as “text” (content of Literal 8 in LYNX terminal)
- I4 _ I—Command understood, not executable at present.

Example

Command: I 4—Inquiry of serial number

Response: I 4 _ A _ “0123456789”

Comments

- The serial number response is the content of Literal 8 as entered in the setup.
- The serial number can be used, for example, as a device address in a network solution.
- The response to 14 appears unsolicited after switching on and after the reset command (@).

5. S—SEND STABLE WEIGHT VALUE

Command: S—Send the current stable net weight.

Response:

- S _ S _ WeightValue _ Unit—Current stable weight value.
- S _ I—Weight value is in the current displayed units.
- S _ +—LYNX in overload range.
- S _ -—LYNX in underload range.

Example

Command S—Send a stable weight value.

Response: S _ S _ _ _ _ _ 100.00 _ g.—The current, stable weight value is 100.00 g.

Comments

- The duration of the timeout depends on the device type.
- Weight value is in the current displayed units.

6. SI—SEND WEIGHT VALUE IMMEDIATELY

Command: SI—Send the current net weight value regardless of scale stability.

Response:

- S _ S _ WeightValue _ Unit—Stable weight value.
- S _ D _ WeightValue _ Unit—Non-stable (dynamic) weight value.
- S _ I—Command not executable (scale is currently executing another command, e.g. taring).
- S _ +—LYNX in overload range.
- S _ -—LYNX in underload range.

Example

Command: SI—Send current weight value.

Response: S _ D _ _ _ _ _ 129.07 _ g—The current weight value is unstable (dynamic) and is 129.07g.

Comments

- The response to the command SI is the last internal weight value (stable or dynamic) before receipt of the command SI.
- Weight value is in the current displayed units.

7. SIR—SEND WEIGHT VALUE IMMEDIATELY AND REPEAT

Command: SIR—Send the net weight values repeatedly, regardless of scale stability.

Response:

- S _ S _ WeightValue _ Unit—Stable weight value.
- S _ D _ WeightValue _ Unit—Non-stable (dynamic) weight value.
- S _ I —Command not executable (LYNX terminal is executing another command, e.g. taring).
- S _ + —LYNX in overload range.
- S _ - —LYNX in underload range.

Example

Command: SIR—Send current weight values at intervals.

Response:

- S _ D _ _ _ _ _ 129.07 _ g
- S _ D _ _ _ _ _ 129.08 _ g
- S _ D _ _ _ _ _ 129.09 _ g
- S _ D _ _ _ _ _ 129.09 _ g
- S _ D _ _ _ _ _ 114.87 _ g
- . . .—The scale sends stable or non-stable weight values at intervals.

Comments

- SIR is overwritten and cancelled by the commands S, SI, SIR, @ and hardware break.
- The number of weight values per second depends on the scale type.
- Weight value is in the current displayed units.

8. T—TARE

Command: T—Tare, i.e. store the next stable weight value as a new tare weight value.

Response:

- T _ S _ WeightValue _ Unit—Taring performed, i.e. stability criterion and taring range complied with. The tare weight value returned corresponds to the weight change in the first unit on the LYNX terminal since the last zero setting.
- T _ I—Taring not performed (LYNX terminal is currently executing another command, e.g. zero setting, or timeout as stability was not reached.)
- T _ + —Upper limit of taring range exceeded.

- T _ - —Lower limit of taring range exceeded.

Example

Command: T—The LYNX terminal is tared and has a value of 100.00 g in the tare memory.

Response: T _ S _ _ _ _ _ 100.00 _ g

Comments

- The tare memory is overwritten by the new tare weight value.
- The duration of the timeout depends on the scale type.
- The function of the combined tare and zero setting key corresponds to the zero setting (Z) command of the interface.
- Clearing tare memory: See command TAC (MT-SICS level 1).
- First unit is the weight unit displayed after the LYNX terminal has been switched on.

9. Z—ZERO

Command: Z—Zero the scale.

Response

- Z _ A—The following then holds:
  - Gross = net + tare = 0
  - Zero setting performed, i.e. stability criterion and zero setting range complied with.
- Z _ I—Zero setting not performed (LYNX terminal is currently executing another command, e.g. taring, or timeout as stability was not reached.)
- Z _ + —Upper limit of zero setting range exceeded.
- Z _ - —Lower limit of zero setting range exceeded.

Example

Command: Z—Zero.

Response: Z _ A—Zero setting performed.

Comments

- The tare memory is cleared during zero setting.
- The zero point determined during switching on is not influenced by this command, i.e. the measurement ranges remain unchanged.
- The duration of the timeout depends on the scale type.

10. @—RESET

Command: @—Reset the scale to the condition found after switching on, but without a zero setting being performed.

Response:

- I 4 _ A _ “text”—Serial number of the scale, the scale is ready for operation.

Example

Command: @

Response: I4 _ A _ “0123456789”—The LYNX terminal is reset and sends the serial number.

Comments

- All commands awaiting responses are canceled.
- The tare memory is reset to zero.
- The “reset” command is always executed.
- A reset command received by the LYNX terminal during the calibration and test procedure can not be processed.

Commands and Responses MT-SICS Level 1

Only the listed Level 1 commands are available.

The following commands of MT-SICS level 1 are available:

- SR—Send weight value on weight change (Send and Repeat)
- TA—Set tare value
- TAC—Clear tare value
- TI—Tare Immediately

1. SR—SEND WEIGHT VALUE ON WEIGHT CHANGE (SEND AND REPEAT)

Command: SR

- S R _ PresetValue _ Unit—Send the current stable weight value and then continuously after every weight change greater or equal to the preset value a non-stable (dynamic) value followed by the next stable value, range = 1d to max. load.
- SR—If no preset value is entered, the weight change must be at least 12.5% of the last stable weight value, minimum = 30d.

Response:

- S _ S _ WeightValue _ Unit—Current, stable weight value. Weight change.
- S _ D _ WeightValue _ Unit—Dynamic weight value.
- S _ S _ WeightValue _ Unit—Next stable weight value.
- S _ I—Command not executable (the LYNX terminal is currently executing another command, e.g. taring, or timeout as stability was not reached.)
- S _ L —Command understood, parameter wrong.
- S _ + —LYNX in overload range.
- S _ - —LYNX in underload range.

Example

Command: S R _ 10.00 _ g—Send the current stable weight value followed by every load change ≥ 10g.

Response:

- S _ S _ _ _ _ _100.00 _ g—Scale stable.
- S _ D _ _ _ _ _115.23 _ g—100.00 g loaded.
- S _ S _ _ _ _ _200.00 _ g—Scale again stable.

Comments

- SR is overwritten and cancelled by the commands S, SI, SIR, @ and hardware break.

- If, following a non-stable (dynamic) weight value, stability has not been reached within the timeout interval, the response “S _ I “ is sent and then a non-stable weight value. Timeout then starts again form the beginning.
- The preset value must be entered in the first unit, that is the weight unit displayed after the LYNX terminal has been switched on.

2. TA - INQUIRE/ENTER TARE VALUE

Inquiry of Tare Weight Value

Command: TA—Inquiry of tare weight value *or* TA _ Tare Preset Value _ Unit—Entry of a tare value.

Response:

- T A _ A _ TareWeightValue _ Unit—Current Tare weight value.
- T A _ I—Current Tare weight value can not be transfered (the LYNX terminal is currently executing another command, e.g. zero setting).
- T A _ L—Command understood, parameter wrong.

Example

Command: T A _ 100.00 _ g—Tare.

Response: T A _ A _ _ _ _ _100.00_ g—The LYNX has 100.00 g in the tare memory.

Comments

- The tare memory will be overwritten by the preset tare weight value.
- The inputted tare value will be automatically rounded by the LYNX to the current readability.
- The preset value must be entered in the current units.

3. TAC - CLEAR TARE VALUE

Command: TAC—Clear tare value.

Response:

- TAC _ A—Tare value cleared, 0 is in the tare memory.
- TAC _ I—Command not executable (the LYNX terminal is currently executing another command, e.g. zero setting, or timeout as stability was not reached).

4. TI - TARE IMMEDIATELY

Command: TI—Tare immediately, i.e. store the current weight value, which can be stable or non-stable (dynamic), as tare weight value.

Response:

- T I _ S _ WeightValue _ Unit—Taring performed, stable tare value. Taring range complied with. The new tare value corresponds to the weight change on the scale since the last zero setting.
- T I _ D _ WeightValue _ Unit—Taring performed, non-stable (dynamic) tare value. Taring range complied with.
- T I _ I—Taring not performed (the LYNX terminal is currently executing another command, e.g. zero setting.)
- T I _ L—The command is not executable.

- T I _ + —Upper limit of taring range exceeded.
- T I _ - —Lower limit of taring range exceeded.

Example

Command: TI—Tare.

Response: T I _ D _ _ _ _ _117.57 _ g—The tare memory holds a non-stable (dynamic) weight value.

Comments

- The tare memory will be overwritten by the new tare weight value.
- After a non-stable (dynamic) stored tare weight value, a stable weight value can be determined. However, the absolute value of the stable weight value determined in this manner is not accurate.
- The stored tare weight value is sent in the current units.

Appendix 3: Discrete I/O Reference

The LYNX terminal has a discrete I/O port with three programmable inputs and five programmable outputs.

Inputs

Inputs can be programmed as various commands including tare, clear tare, zero scale, print, switch units or blank display.

The inputs are TTL compatible and are capable of handling from 5 to 24 volt DC signals. To initiate one of the inputs, you must ground the input terminal for the desired function. Some input functions are edge triggered and must be held at logic ground level for at least 100 ms. Other input functions are level triggered and are active as long as the input is held at logic ground. The following table defines the available functions:

FUNCTION NAME	TYPE	DESCRIPTION OF ACTION
Tare	Edge	Tares the Scale to a Net Mode
Clear	Edge	Clears the Scale to a Gross Mode
Zero	Edge	Zeros the Scale
Print	Edge	Initiates a Print
Switch Units	Edge	Switches the Scale Weight Units
Blank Display	Level	Blanks the Weight Display
Dynamic	Edge	Initiates Dynamic Weighing
Inhibit Keypad	Level	Inhibits Use of the LYNX Keypad
X10 Weight	Level	Causes the Weight to be Display X10 Precision
Accumulator Total	Edge	Recall the Accumulator Total to the Display
None	N/A	Input Not Assigned
OK to Feed	Level	Enables Feed In Prompt Mode
OK to Discharge	Level	Enables Discharge in Prompt Mode
Advance Prompt	Edge	Advances to Next Prompt or From the Normal Weighing mode to the first prompt

It is not necessary to supply any voltage to the inputs when not triggering. Internally, a 5 volt power supply with a pull-up resistor keeps the inputs in the “OFF” condition.

Because the signals are low level, the maximum recommended distance between the LYNX terminal and the device triggering the input (a switch or relay contact) is 10 feet or less.

The LYNX terminal has an internal diagnostic test to verify that each input is functional. See the section entitled Diagnostics and Maintenance Program Block in Chapter 3 of this manual for more information.

The following diagram shows a typical wiring scheme.

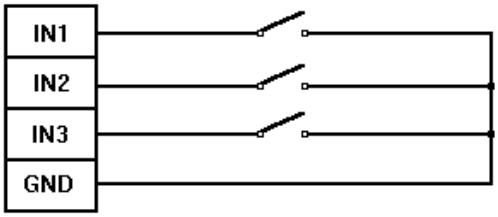


Figure A3-1 Standard Input Wiring

Outputs

Outputs can be programmed for various indications including setpoints, gross/net mode, center of zero, scale in motion, over-capacity, or under zero.

The outputs are TTL compatible, current-sinking components which can handle from 5 to 24 volt DC signals at a maximum of 35 mA current. A solid state relay or OPTO 22 is typically connected to buffer the LYNX terminal outputs to a 120 or 220 volt AC signal. The following output functions are available:

FUNCTION NAME	DESCRIPTION
Setpoint	Single Speed Coincidence Setpoint
Net	Scale in Net Mode Indication
Zero	Scale at Center of Zero
Motion	Scale in Motion
Over Capacity	Scale Over Capacity
Under Zero	Scale Negative
None	Output Not Assigned

An output terminal supplies a 5 volt DC supply for reference to the setpoint outputs. Because the supply is rated at 115 mA of DC current, it is important to make sure that the total current draw from the devices you are using (relays or optos) does not exceed this limit. If the calculated current draw exceeds 115 mA, an external power supply is required. External power supplies are available from the Systems group of Mettler Toledo or through your local authorized Mettler Toledo representative.

The setpoint outputs are negative true and “ON” when the scale weight is below the setpoint coincidence value. The setpoints operate on the absolute value of the scale weight so they can be used for both weigh-in and weigh-out processes. The source for the setpoint weight can be gross weight, displayed weight, or net weight. If net weight is selected, the output does not “turn on” until tare as been taken.

The LYNX terminal has an internal diagnostic test to verify that each output is functional. See the section entitled Diagnostics and Maintenance Program Block in Chapter 3 of this manual for more information.

The W2 jumper must be installed between pins 1 and 2 for +5 VDC power for Opto 22 blocks.

The following diagram shows a typical wiring scheme.

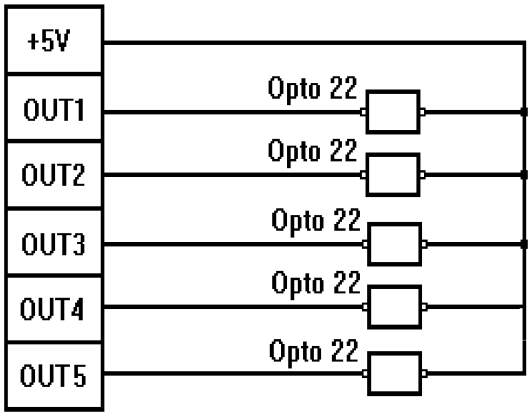

Figure A3-2 Standard Output Wiring

Automatic Filling System Control

The LYNX terminal may be used to control an automatic, single material filling system. Filling sequence logic is implemented within a LYNX prompt list by programming the required sequence as a list of commands in the prompt list. The LYNX terminal has the following features for filling:

- Single or Two-Speed Material Feeder Control
- Single-Speed Discharge Control
- Preact for Material In-Flight Compensation
- Material In-Tolerance Output
- Weigh-In or Weigh-Out Operation
- Net or Gross Weight Setpoints
- OK to Feed Input (Discharge Gate Closed)
- OK to Discharge Input (Downstream Ready)
- Remote Start/Continue Input (Advance Prompt Input)

Filling System Configuration

Configuration of the LYNX terminal for filling begins with an understanding of the material handling system that will be controlled. Following are several of the typical system configurations:

- **Single-Speed Feed, No Discharge** – the container to be filled is placed on the scale then filled automatically to a net or gross amount.
- **Two-Speed Feed, No Discharge** – the container to be filled is placed on the scale then filled automatically to a net amount where two speed feed offers an improvement in filling accuracy.
- **Single-Speed Feed, Discharge** – the scale is a tank or hopper that is filled to a net amount then discharged to zero to deliver the material to a downstream process.
- **Two-Speed Feed, Discharge** – the scale is a tank or hopper that is filled to a net amount then discharged to zero to deliver the material to a downstream process where two speed feed offers an improvement in filling accuracy.
- **Automatic Tank or Hopper Refill Control** – the scale is a tank or hopper that must be refilled to a gross amount once its level drops below a refill setpoint.

Input Assignments

The LYNX terminal has three standard inputs that are programmable, but when feeder control or discharge control is used, there are some mandatory assignments. These

assignments are made in setup in the Discrete Program Block. Refer to chapter 2 for details on how to make these assignments. These are the mandatory assignments:

- **OK to Feed** - If feeder control is used, one input must be assigned to OK to Feed. The OK to Feed input is typically wired to the discharge valve closed or discharge gate closed limit switch or a sensor that indicates that a container is in place. The input must be wired in series with a normally closed emergency stop switch.
- **OK to Discharge** - If discharge control is used, one input must be assigned to OK to Discharge. The OK to Discharge input is typically wired to downstream equipment to indicate that material handing equipment is operational to accept the material. The input must be wired in series with a normally closed emergency stop switch.
- **Advance Prompt** – In many applications, it is desirable to use an industrial operator in place of the LYNX terminal's keypad for initiating a feed or discharge sequence. This can be accomplished by assigning one of the inputs to Advance Prompt. This causes the LYNX terminal to monitor the input and jump to the first prompt from the normal weighing mode or to advance to the next prompt step if the input turns on. Typically, this would be used to advance from an A/N prompt, with a length of zero, that tells the operator what is expected (such as PUSH START) followed by the feed or discharge prompt step.

Unused inputs may be assigned to any of the standard input functions as listed in the beginning of Appendix 3.

Input Wiring

The Lynx filling controller model (LTFA) provides pre-configured and pre-wired push buttons and I/O for a filling application.

The inputs on the LYNX terminal controller board are low level so the wiring to them must not extend beyond ten feet. If the wiring must extend further, you must use high level input buffer relays. Solid state relays, such as those manufactured by OPTO22, are commonly used. If all of the relays on the LYNX High Level Setpoint Output Option are not used for outputs, you can insert input modules and wire these relays to the LYNX terminal PAR1 inputs. Otherwise, an external high level relay board is required. Some typical wiring diagrams for using the LYNX terminal for a filling system follow later in this appendix.

Output Assignments

The LYNX terminal has five standard outputs that are programmable but when feeder control or discharge control is used, there are some mandatory assignments. These assignments are made in setup in the Discrete Program Block. Refer to chapter 3 for details on how to make these assignments. These are the mandatory assignments:

Setpoint Configuration – Use the following table to determine the appropriate configuration of the outputs:

System Configuration		Parameter Settings	
Feeder	Discharge	#-2 Speed Setpoints	Use Setpoint 2
1 Speed	None	0	N/A
1 Speed	1 Speed	0	N/A
2 Speed	None	1	No
2 Speed	1 Speed	1	Yes
2 Speed	2 Speed	2	N/A

Feed - If feeder control is used, output one must be assigned to setpoint 1 (SP1) and must be configured as "Feed." Setpoint 1 will act as the material feed cutoff and may have a dribble and preact associated with it.

Discharge - If discharge control is used, output two must be assigned to setpoint 2 (SP2) and must be configured as "Dsch." Setpoint 2 will act as the discharge cutoff. It may also have a dribble and preact associated with it.

Unused outputs may be assigned to any of the standard output functions as listed in the beginning of Appendix 3.

Use a Lynx Filling Controller if self-contained controller is preferred.

Output Wiring

The outputs on the LYNX terminal controller board are low level so they are not appropriate to drive external devices, such as motor starters or solenoids. It is necessary to buffer these low level signals to a higher level. The LYNX High Level Setpoint Output Option is ideal for buffering the outputs to a high level. Otherwise, an external high level relay board is required such as the solid state relay products manufactured by OPTO 22. Some typical wiring diagrams for using a LYNX terminal for a filling system follow.

Typical LYNX Filling System Wiring Diagrams

The hardware and software of the LYNX terminal provide for flexibility in wiring and configuring a LYNX terminal for filling system control. The following diagrams illustrate some common wiring diagrams for various filling system application configurations of the LYNX terminal. These diagrams are applicable to both the panel mount and harsh environment models of the LYNX terminal. The I/O Board shown is the LYNX High Level Output Option. The 0961-0086 I/O Accessory Box could also be used.

Appendix 4: Loading LYNX Software

The LYNX terminal is designed to allow easy software installation and upgrade. Using Mettler Toledo's "Flashpro" installation program from a personal computer, you can easily load the latest version of LYNX software and burn it into the terminal's flash memory. Upgrade software will be available from Mettler-Toledo as enhancements are made.

Flash the Software

Do not perform the file download from within the Windows environment. Exit Windows and perform the following steps from the DOS prompt.

The first step is to extract the new LYNX files from the floppy disk onto the personal computer. To extract the files:

1. Create a directory and go to the directory on the PC where the new files will be stored. Use the DOS MD command if you need to create a new directory to hold the LYNX files, and the CD command to change directories.
2. Insert the diskette with the new software files into the floppy disk drive A or B. The files on this diskette are compressed into a single file named LYNX_X.EXE where "X" represents the revision.
3. At the DOS prompt, type **A:LYNX_X** or **B:LYNX_X** depending on where you inserted the diskette, then press **ENTER**.

   The compressed files will automatically extract themselves from LYNX_X.EXE into the designated directory on the computer. The extracted files require approximately 1.3 MEG of storage space on the PC's hard drive.
4. Edit the FP.BAT file using the DOS text editor or another and verify the new software name and serial port are correct. The FP.BAT file resembles the example below. Edit only the -t and -com elements.

   Example:

   flashpro -tD145828R -b115.2 -com1 -pe -d7 -s1

   where:
   -t is followed by the file name to be flashed such as D145828R.

   -b is the baud rate (in kbaud). The software is transferred at 115.2 kbaud. DO NOT CHANGE THIS PARAMETER.

   -com is the serial com port on the personal computer that will be used to transfer the new software to the LYNX terminal.

   -p is the parity. The parity is set to even. DO NOT CHANGE THIS PARAMETER.

   -d is the number of data bits used. Data bits are set to seven. DO NOT CHANGE THIS PARAMETER.

   -s is the number of stop bits used. Stop bits are set to one. DO NOT CHANGE THIS PARAMETER.

You are now ready to use the flashpro batch file (FP.BAT) to load the software into the LYNX terminal's flash memory.

To load LYNX software:

If another device is connected to COM1, be sure to disconnect all wires prior to connecting the RS-232 cable.

1. Disconnect power to the LYNX terminal.
2. Open the harsh environment (desk/wall) model as described in Chapter 2 of this manual, or remove the Controller PCB from the panel mount model. Turn Switch 1-3 ON.
3. Connect a bi-directional RS-232 cable from a personal computer to the LYNX terminal's COM1 serial port. Wire the cable as follows:

LYNX COM1	9-pin COM	25-pin COM
TxD	2	3
RxD	3	2
Gnd	5	7

4. Carefully reinstall the front panel of the desk/wall unit or reinstall the Controller PCB for the panel mount model.
5. Apply power to the LYNX terminal and wait until the unit has completed its power-up sequence and displays the **Download** prompt.
6. With the cursor in the directory containing the LYNX terminal program files, type FP at the DOS prompt, and press **ENTER** to execute the command.

   The computer monitor flashes the message **Wake Up** three times, then **Acknowledge** before a framed box scrolling a string of A's appears on the computer monitor indicating the installation has begun.

   The box will continue to scroll A's until the installation procedure is complete. This process will continue with brief pauses occasionally for about 5 to 7 minutes depending on your computer. If the box with A's does not appear, press **ESCAPE** on the computer and remove power from the LYNX terminal. Repeat steps 4 through 6.

   If the new software was downloaded successfully, the message FILE SUCCESSFULLY TRANSFERRED is displayed in the framed box on the computer monitor. The LYNX terminal then displays **SW1-3 ON?**

   During the power-up sequence, the storage locations for setup parameters and memory fields are checked. If any have been moved or added in the new version of software, the LYNX terminal responds with the following error messages:

   BRAM Bad
   EEPROM Bad

7. Press **ENTER** to acknowledge the messages. In this case, the LYNX terminal automatically resets the configuration data to factory defaults.
8. Disconnect power from the LYNX terminal, then open the desk/wall unit or remove the Controller PCB from the panel mount model. Turn Switch 1-3 OFF, then carefully close the desk/wall unit or replace the Controller PCB for the panel mount model.

Appendix 5: Geo Values

The values for gravity adjustment [Geo Val?XX] are a series of numbers in the range 0 to 31, as shown in the Table.

Geo Value Table	Height above sea level in meters										
	0	325	650	975	1300	1625	1950	2275	2600	2925	3250
North or south latitude	Height above sea level in feet										
in degrees and minutes	0	1060	2130	3200	4260	5330	6400	7460	LYNX	9600	10660
0^0 0' - 5^0 46'	5	4	4	3	3	2	2	1	1	0	0
5^0 46' - 9^0 52'	5	5	4	4	3	3	2	2	1	1	0
9^0 52' - 12^0 44'	6	5	5	4	4	3	3	2	2	1	1

TABLE NOTES

* - ENGLISH OKAY FOR TECHNICAL DOCUMENTATION

** - Kcs HAS A SMALL "v" ABOVE THE LETTER "c".

*** - CURRENCY ABBREVIATION IS NOT KNOWN - NO RETAIL MARKET.

**** - THE LETTER "W" FOR WON HAS A DOUBLE LINE (=) THROUGH THE MIDDLE.

PREFERRED LANGUAGE - Language that is normally accepted in that region.

ALTERNATE LANGUAGE - Language (Eng, Span, Fren, Germ) that is also acceptable.

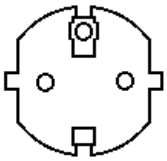
PWR CORD CONFIG - The "one" configuration most accepted in that region. See configurations below.

RETAIL CURRENCY - The full official name of the currency used.

CURRENCY ABBREV - The currency abbreviation that should appear on keys and displays.

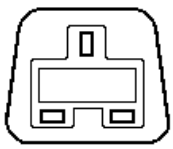
Configuration A

U.S./Canada



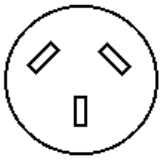
Configuration B

"SCHUKO" Continental Europe (CEE7)



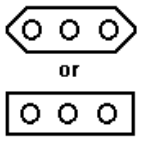
Configuration C

United Kingdom
Fuse is required.



Configuration D

Australia

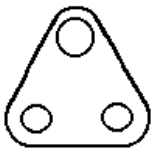


Configuration E

Italy and Chile
Old style Italy. Use SCHUKO (B) for new designs.

Configuration F

Europlug (CEE7/16)
Use for grounded equipment only if separate ground connection is provided.



Configuration G

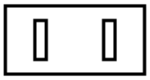
India (Old British)

Configuration H

Israel

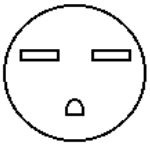
Configuration I

Japan (J1S 8303 spec)



Configuration J

Flat Blade – Undergrounded
Use for grounded equipment only if separate ground connection is provided.

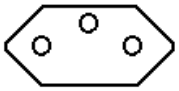


Configuration K

U.S./Canada (220 V)

Configuration L

Old Denmark (Use “N”)



Configuration M

Switzerland (Use “B”)

Configuration N

Denmark

Appendix 7: LYNX Default Values

The following lists the factory default values for each program block. Use the As Configured column to record your actual setup configuration.

Scale Interface Program Block			
Default	As Configured	Default	As Configured
Market		**Linearity Correction**	
USA		No	
Scale Type		**Shift Adjustment**	
Type - Analog		Zero counts - 74000	
Number of load cells - 4		Mid weight - 100.000	
Cell #1 - Shift Factor - 1.000000		Mid counts - 1040600	
Cell #2 - Shift Factor - 1.000000		High weight - 100.000	
Cell #3 - Shift Factor - 1.000000		High counts - 1040600	
Cell #4 - Shift Factor - 1.000000		**Calibration**	
		No defaults	
Calibration Unit		**Zero Adjustment**	
Pounds (lb)		No defaults	
Capacity		**Span Adjustment**	
100.00		No defaults	
Increment Size		**Geo Value**	
0.01		16	

Application Environment Program Block			
Default	As Configured	Default	As Configured
Character Set		Key Time-Out – O seconds	
USA		Select Key Assignment - None	
Time/Date Format		**Zero Operations**	
Time Separator - :		Power-up Zero	
Time Format - None		Positive Range - 0%	
Date Separator - (-)		Negative Range - 0%	
Date Format - None		Pushbutton Zero	
Weight Units		Positive Range - 2%	
Enable Second Units - No		Negative Range - 2%	
Second Display Units - kg		Under Zero Blanking - 5 divisions	
Custom Units Factor - 1.0		Auto Zero Maintenance	
Custom Units Name - ***		Range - 0.5 divisions	
Power-up Operations		AZM Enabled in Net Mode - No	
Power-up Timer - 0 min.		Zero Indication - Gross	
Tare Operations		**Stability Detection**	
Enable Tare - Yes		Stability Range - 1.0 divisions	
Tare Interlock - No		Stability Interval - 0.4 seconds	
Pushbutton Tare – Yes		**Vibration Rejection**	
Keyboard Tare – Yes		Low Pass Filter	
Tare Recall – Yes		Frequency - 2.0 Hz	
Gross Recall - No		Poles - 8	
Auto Tare - No		Notch Filter Frequency - 30.0 Hz	
Tare Threshold - 5		Noise Filter - No	
Reset Threshold - 0.5			
Check Motion - No			
Auto Clear Tare - No			
After Print - No			
Threshold - 0.5			
Net Sign Correction - No			

Serial I/O Program Block			
Default	As Configured	Default	As Configured
Configure Port		Output Mode - None	
COM1		Input Mode - None	
Port Parameters		COM3	
Baud Rate - 9600		Port Parameters	
Data Bits - 7		Baud Rate - 9600	
Stop Bits - 1		Data Bits - 7	
Parity - Even		Stop Bits - 2	
Flow Control - None		Parity - Even	
Checksum - No		Flow Control - None	
Output Mode - Demand		Checksum - No	
Decimal Point/Comma - DP		Output Mode - None	
Format - /ptp01		Input Mode - None	
Input Mode - Command		**Printer Control**	
COM2		Minimum Print - No	
Port Parameters		Print Interlock - No	
Baud Rate - 9600		Auto Print - No	
Data Bits - 7		Print Threshold - 5	
Stop Bits - 2		Reset Threshold - 0.5	
Parity - Even		Check Motion - No	
Flow Control - None			
Checksum - No			

Configure Template Program Block	
Default	As Configured
Defaults given in Appendix 1	

Discrete I/O Program Block			
Default	As Configured	Default	As Configured
Discrete Inputs		**Discrete Outputs**	
Input Point 1 - Tare		Output Points 1 through 5 - None	
Input Point 2 - Clear			
Input Point 3 - Print			

Memory Program Block			
Default	As Configured	Default	As Configured
Configure Literals		Prompt #2	
Literal #1 - The LYNX terminal		Type - Numeric	
Literal #2 - From Mettler Toledo		Length - 8	
Literals #3-10 - Blank		Prompt - PART NO?	
Literal #11 - GROSS		CLR Data - Yes	
Literal #12 - TARE		Prompt #3	
Literal #13 - NET		Type - Numeric	
Literal #14 - TIME		Length - 8	
Literal #15 - DATE		Prompt - LOCATION?	
Literal #16 - CNV. FACTOR		CLR Data - Yes	
Literal #17 - NUMBER		Prompts #4 through 10 - Blank	
Literal #18 - WEIGHT		**Configure CN**	
Literal #19 - SUBTOTAL		Enable CN - Yes	
Literal #20 - TOTAL		Start At - 0	
Configure Prompts		Enable Reset - Yes	
Prompt Steps - 0		Enable Preset - Yes	
Prompt #1			
Type - Numeric			
Length - 8			
Prompt - OPERATOR?			
CLR Data - Yes			

Operational Program Block			
Default	As Configured	Default	As Configured
Options		Auto Assign Quick ID - Yes	
Analog Output		Inbound Auto Print - No	
Data Source - Displayed Wt.		Outbound Auto Print - Yes	
Zero Weight 0.00		Prompt for Description - None	
Full Scale Weight - 100.00		Execute Prompt List - None	
BCD Output		Report Configuration	
Data Source - Displayed Wt.		Print ID - Yes	
Accumulation		Print Record ID - Yes	
Source - None		Print Description - No	
Auto Clear Total - No		Print Tare - Yes	
Enable Subtotal - Yes		Print Accumulator - Yes	
Auto Clear Subtotal - No		Print Transaction Number - Yes	
Convert Weight Units - Yes		**Passwords**	
Report Configuration		Passwords 1234	
Print Literal #9 - Yes		Protect Clear Totals - No	
Print Literal #10 - Yes		Protect Clear Subtotals - No	
Print Time - Yes		Protect Permanent Tares - No	
Print Date - Yes		Protect All Ids - No	
Print CN - Yes		Protect Single Ids - No	
Print Subtotal - Yes		Protect Open Ids - No	
ID/Tare Accumulation		Protect ID Totals/Subtotals - No	
Enable ID/Tare - No		Protect Setpoint Entry - No	
Manual Entry - No		**Dynamic Weighing**	
Auto Clear - No		Enable Dynamic - No	
Trigger - No		Time Interval - 5.0 seconds	
# of Transactions - No		Auto Print - No	

Diagnostics and Maintenance Program Block			
Default	As Configured	Default	As Configured
Memory Test - No defaults		**Serial Test - No default**	
Display Test - No defaults		**Discrete I/O Test - No default**	
Keyboard Test - No defaults		**Print Setup - No defaults**	
Scale Test - No defaults
